# Chapter 1

## libquentier

Set of Qt/C++ APIs for feature rich desktop clients for Evernote service

### 1.1 What's this

This library presents a set of Qt/C++ APIs useful for applications working as feature rich desktop clients for Evernote service. The most important and useful components of the library are the following:

- Local storage - persistence of data downloaded from Evernote service in a local SQLite database
- Synchronization - the logics of exchanging new and/or modified data with Evernote service
- Note editor - the UI component capable for notes displaying and editing

The library is based on the lower level functionality provided by `QEverCloud` library. It also serves as the functional core of `Qentier` application.

**1.1.1 WARNING: libquentier is in alpha state right now, neither API nor ABI can be considered stable yet!**

### 1.2 How to build/install

Please see the building/installation guide.

### 1.3 How to contribute

Please see the contribution guide for detailed info.

# Chapter 2

## Hierarchical Index

### 2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

quentier::ApplicationSettings::ArrayCloser . . . . .	30
quentier::synchronization::AuthenticationExpiredError . . . . .	30
quentier::synchronization::ISyncConflictResolver::ConflictResolution . . . . .	31
quentier::ApplicationSettings::GroupCloser . . . . .	45
quentier::synchronization::IAuthenticationInfoBuilder . . . . .	48
quentier::synchronization::IAuthenticator . . . . .	48
quentier::synchronization::tests::mocks::MockIAuthenticator . . . . .	122
quentier::ResourceRecognitionIndexItem::IBarcodeItem . . . . .	49
quentier::utility::cancelers::ICanceler . . . . .	49
quentier::utility::cancelers::AnyOfCanceler . . . . .	19

# Chapter 3

## Class Index

### 3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">quentier::Account</a>	Encapsulates some details about the account: its name, whether it is local or synchronized to Evernote and for the latter case - some additional details like upload limit etc . . . . .	15
<a href="#">quentier::utility::cancelers::AnyOfCanceler</a>		19
<a href="#">quentier::ApplicationSettings</a>	Enhances the functionality of QSettings, in particular it simplifies the way of working with either application-wide or account-specific settings . . . . .	20
<a href="#">quentier::ApplicationSettings::ArrayCloser</a>		30
<a href="#">quentier::synchronization::AuthenticationExpiredError</a>		30
<a href="#">quentier::synchronization::ISyncConflictResolver::ConflictResolution</a>	The <a href="#">ConflictResolution</a> struct is a namespace inside which several other structs determining actual conflict resolutions . . . . .	31
<a href="#">quentier::EncryptionManager</a>	Both synchronous methods to encrypt or decrypt given text with password, cipher and key length and their signal-slot based potentially asynchronous counterparts . . . . .	31
<a href="#">quentier::ErrorString</a>	Encapsulates two (or more) strings which are meant to contain translatable (base) and non-translatable (details) parts of the error description . . . . .	33
<a href="#">quentier::EventLoopWithExitStatus</a>		35
<a href="#">quentier::IKeychainService::Exception</a>	The <a href="#">IKeychainService::Exception</a> class is the base class for exceptions returned inside QFutures from methods of <a href="#">IKeychainService</a> . . . . .	36
<a href="#">quentier::FileCopier</a>		38
<a href="#">quentier::FileIOProcessorAsync</a>	Wrapper under simple file IO operations, it is meant to be used for simple asynchronous IO . . . . .	39
<a href="#">quentier::FileSystemWatcher</a>		42
<a href="#">quentier::utility::cancelers::FutureCanceler&lt; T &gt;</a>		43
<a href="#">quentier::ApplicationSettings::GroupCloser</a>		45
<a href="#">quentier::synchronization::IAuthenticationInfo</a>	The <a href="#">IAuthenticationInfo</a> interface represents the information obtained through OAuth and necessary to access Evernote API . . . . .	45
<a href="#">quentier::synchronization::IAuthenticationInfoBuilder</a>		48
<a href="#">quentier::synchronization::IAuthenticator</a>		48
<a href="#">quentier::ResourceRecognitionIndexItem::IBarcodeItem</a>		49

<a href="#">quentier::utility::cancelers::ICanceler</a>	
The <a href="#">ICanceler</a> interface provides <code>isCanceled</code> method which can be used to check whether some processing can be skipped because it was canceled . . . . .	49
<a href="#">quentier::enml::IConverter</a>	
The <a href="#">IConverter</a> interface encapsulates a set of methods performing conversions between ENML and other note content formats, namely HTML . . . . .	50
<a href="#">quentier::enml::IDecryptedTextCache</a> . . . . .	56
<a href="#">quentier::synchronization::IDownloadNotesStatus</a>	
The <a href="#">IDownloadNotesStatus</a> interface presents information about the status of notes downloading process . . . . .	56
<a href="#">quentier::synchronization::IDownloadResourcesStatus</a> . . . . .	58
<a href="#">quentier::enml::IENMLTagsConverter</a>	
The <a href="#">IENMLTagsConverter</a> interfaces provides methods which convert Evernote-specific markup tags such as <code>en-crypt</code> , <code>en-media</code> etc. into their counterparts which should be used in the HTML representation of note content . . . . .	59
<a href="#">quentier::synchronization::ISyncConflictResolver::ConflictResolution::IgnoreMine</a>	
The <a href="#">IgnoreMine</a> conflict resolution means "use theirs version and ignore mine version as it doesn't really conflict with theirs version" . . . . .	62
<a href="#">quentier::enml::IHtmlData</a>	
The <a href="#">IHtmlData</a> represents the result of ENML to HTML conversion: HTML itself plus some meta-data . . . . .	62
<a href="#">quentier::IKeychainService</a>	
The <a href="#">IKeychainService</a> interface provides the ability to interact with the storage of sensitive data - read, write and delete it . . . . .	64
<a href="#">quentier::local_storage::ILocalStorage</a> . . . . .	67
<a href="#">quentier::local_storage::ILocalStorageNotifier</a> . . . . .	72
<a href="#">quentier::INoteEditorBackend</a> . . . . .	73
<a href="#">quentier::synchronization::INoteStoreFactory</a> . . . . .	76
<a href="#">quentier::InvalidArgument</a> . . . . .	77
<a href="#">quentier::ResourceRecognitionIndexItem::IObjectItem</a> . . . . .	78
<a href="#">quentier::local_storage::IPatch</a>	
The <a href="#">IPatch</a> interface represents patches of the local storage. Each such patch somehow changes the layout of local storage persistence so that only compliant & corresponding versions of <code>libquentier</code> can be used to work with it . . . . .	78
<a href="#">quentier::IQuentierException</a>	
Interface for exceptions specific to <code>libquentier</code> and applications based on it . . . . .	81
<a href="#">quentier::synchronization::ISendStatus</a>	
The <a href="#">ISendStatus</a> interface represents the information about the attempt to send information either from user's own account or from some linked notebook to Evernote . . . . .	82
<a href="#">quentier::ResourceRecognitionIndexItem::IShapeltem</a> . . . . .	86
<a href="#">quentier::enml::conversion_rules::ISkipRule</a>	
The <a href="#">ISkipRule</a> interface describes a conversion rule with regards to which some ENML/HTML element/attribute should be skipped during the conversion . . . . .	87
<a href="#">quentier::enml::conversion_rules::ISkipRuleBuilder</a> . . . . .	89
<a href="#">quentier::synchronization::ISyncChunksDataCounters</a>	
The <a href="#">ISyncChunksDataCounters</a> interface provides integer counters representing the current progress on processing the data from downloaded sync chunks . . . . .	90
<a href="#">quentier::synchronization::ISyncConflictResolver</a>	
The <a href="#">ISyncConflictResolver</a> interface provides methods used to resolve conflicts between local and remote versions of the same data item . . . . .	94
<a href="#">quentier::synchronization::ISyncEventsNotifier</a> . . . . .	95
<a href="#">quentier::synchronization::ISynchronizer</a> . . . . .	100
<a href="#">quentier::synchronization::ISyncOptions</a>	
Options for synchronization process . . . . .	101
<a href="#">quentier::synchronization::ISyncOptionsBuilder</a> . . . . .	103
<a href="#">quentier::synchronization::ISyncResult</a> . . . . .	103
<a href="#">quentier::synchronization::ISyncState</a>	
The <a href="#">ISyncState</a> interface provides accessory methods to determine the sync state for the account	104

<a href="#">quentier::synchronization::ISyncStateBuilder</a> . . . . .	106
<a href="#">quentier::synchronization::ISyncStateStorage</a>	
The <a href="#">ISyncStateStorage</a> interface represents the interface of a class which stores sync state for given accounts persistently and provides access to previously stores sync states . . . . .	106
<a href="#">quentier::ResourceRecognitionIndexItem::ITextItem</a> . . . . .	108
<a href="#">quentier::synchronization::IUserStoreFactory</a> . . . . .	108
<a href="#">quentier::local_storage::ILocalStorage::ListGuidsFilters</a> . . . . .	108
<a href="#">quentier::local_storage::ILocalStorage::ListLinkedNotebooksOptions</a> . . . . .	108
<a href="#">quentier::local_storage::ILocalStorage::ListNotebooksOptions</a> . . . . .	110
<a href="#">quentier::local_storage::ILocalStorage::ListNotesOptions</a> . . . . .	111
<a href="#">quentier::local_storage::ILocalStorage::ListObjectsFilters</a> . . . . .	112
<a href="#">quentier::local_storage::ILocalStorage::ListOptionsBase</a> . . . . .	112
<a href="#">quentier::local_storage::ILocalStorage::ListSavedSearchesOptions</a> . . . . .	113
<a href="#">quentier::local_storage::ILocalStorage::ListTagsOptions</a> . . . . .	115
<a href="#">quentier::local_storage::LocalStorageOpenException</a>	
The <a href="#">LocalStorageOpenException</a> is thrown on failure to open the local storage database . . . . .	116
<a href="#">quentier::local_storage::LocalStorageOperationException</a>	
The <a href="#">LocalStorageOperationException</a> is thrown when the local storage encounters some internal error during the attempt to process some operation . . . . .	118
<a href="#">quentier::LRUCache&lt; Key, Value, Allocator &gt;</a> . . . . .	119
<a href="#">quentier::utility::cancelers::ManualCanceler</a> . . . . .	120
<a href="#">quentier::synchronization::tests::mocks::MockIAuthenticator</a> . . . . .	122
<a href="#">quentier::utility::tests::mocks::MockIKeychainService</a> . . . . .	123
<a href="#">quentier::local_storage::tests::mocks::MockILocalStorage</a> . . . . .	124
<a href="#">quentier::synchronization::tests::mocks::MockINoteStoreFactory</a> . . . . .	130
<a href="#">quentier::synchronization::tests::mocks::MockISyncConflictResolver</a> . . . . .	131
<a href="#">quentier::synchronization::tests::mocks::MockISyncStateStorage</a> . . . . .	132
<a href="#">quentier::synchronization::ISyncConflictResolver::ConflictResolution::MoveMine&lt; T &gt;</a>	
The <a href="#">MoveMine</a> conflict resolution means "before using theirs version change mine version as specified". Note: the data item inside this conflict resolution might refer to something different than mine version passed to the conflict resolution function. It can be that way because the actual conflict might be with another local data item instead of the passed one . . . . .	133
<a href="#">quentier::NoteEditor</a>	
Widget encapsulating all the functionality necessary for showing and editing notes . . . . .	134
<a href="#">quentier::local_storage::NoteSearchQuery</a> . . . . .	143
<a href="#">quentier::OperationCanceled</a> . . . . .	146
<a href="#">quentier::Printable</a>	
Interface for Quentier's internal classes which should be able to write themselves into QText↔Stream and/or convert to QString . . . . .	148
<a href="#">QPromise&lt; T &gt;</a> . . . . .	149
<a href="#">quentier::QuentierApplication</a> . . . . .	149
<a href="#">quentier::QuentierUndoCommand</a>	
Has the sole purpose of working around one quirky aspect of Qt's undo/redo framework: when you push QUndoCommand to QUndoStack, it calls "redo" method of that command. This class offers subclasses to implement their own methods for actual "undo" and "redo" commands while ignoring the attempts to "redo" anything if there were no previous "undo" call prior to that . . . . .	150
<a href="#">quentier::synchronization::RateLimitReachedError</a> . . . . .	152
<a href="#">quentier::ResourceRecognitionIndexItem</a> . . . . .	152
<a href="#">quentier::ResourceRecognitionIndices</a> . . . . .	154
<a href="#">quentier::Result&lt; T, Error, typename &gt;</a>

## Chapter 5

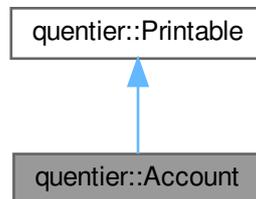

# Class Documentation

### 5.1 `quentier::Account` Class Reference

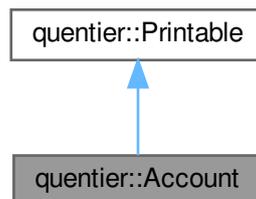

The `Account` class encapsulates some details about the account: its name, whether it is local or synchronized to Evernote and for the latter case - some additional details like upload limit etc.

```
#include <Account.h>
```

Inheritance diagram for `quentier::Account`:

Collaboration diagram for `quentier::Account`:

## Public Types

- enum class **Type** { **Local** , **Evernote** }
- enum class **EvernoteAccountType** { **Free** , **Plus** , **Premium** , **Business** }

## Public Member Functions

- **Account** (QString name, Type type, qevercloud::UserID userId=-1, EvernoteAccountType evernoteAccountType=EvernoteAccountType::Free, QString evernoteHost={}, QString shardId={})
- **Account** (const Account &other)
- **Account** (Account &&other) noexcept
- Account & **operator=** (const Account &other)
- Account & **operator=** (Account &&other) noexcept
- bool **operator==** (const Account &other) const noexcept
- bool **operator!=** (const Account &other) const noexcept
- bool isEmpty () const
- QString name () const
- void **setName** (QString name)
  - setName sets the username to the account*
- QString displayName () const
- void **setDisplayName** (QString displayName)
- Type type () const
- qevercloud::UserID id () const
- EvernoteAccountType evernoteAccountType () const
- QString evernoteHost () const
- QString shardId () const
- void **setEvernoteAccountType** (EvernoteAccountType evernoteAccountType)
- void **setEvernoteHost** (QString evernoteHost)
- void **setShardId** (QString shardId)
- qint32 mailLimitDaily () const
- qint64 noteSizeMax () const
- qint64 resourceSizeMax () const
- qint32 linkedNotebookMax () const
- qint32 noteCountMax () const
- qint32 notebookCountMax () const
- qint32 tagCountMax () const
- qint32 noteTagCountMax () const
- qint32 savedSearchCountMax () const
- qint32 noteResourceCountMax () const
- void **setEvernoteAccountLimits** (const qevercloud::AccountLimits &limits)
- QTextStream & **print** (QTextStream &strm) const override

## Public Member Functions inherited from [quentier::Printable](#)

- QString toString () const

## Friends

- QUENTIER\_EXPORT QTextStream & **operator**<< (QTextStream &strm, Type type)
- QUENTIER\_EXPORT QDebug & **operator**<< (QDebug &dbg, Type type)
- QUENTIER\_EXPORT QTextStream & **operator**<< (QTextStream &strm, EvernoteAccountType type)
- QUENTIER\_EXPORT QDebug & **operator**<< (QDebug &dbg, EvernoteAccountType type)

### 5.1.1 Detailed Description

The `Account` class encapsulates some details about the account: its name, whether it is local or synchronized to Evernote and for the latter case - some additional details like upload limit etc.

### 5.1.2 Member Function Documentation

#### 5.1.2.1 `displayName()`

```
QString quentier::Account::displayName ( ) const
```

##### Returns

`Printable` user's name that is not used to uniquely identify the account, so this name may repeat across different local and Evernote accounts

#### 5.1.2.2 `evernoteAccountType()`

```
EvernoteAccountType quentier::Account::evernoteAccountType ( ) const
```

##### Returns

The type of the Evernote account; if applied to free account, returns "Free"

#### 5.1.2.3 `evernoteHost()`

```
QString quentier::Account::evernoteHost ( ) const
```

##### Returns

The Evernote server host with which the account is associated

#### 5.1.2.4 `id()`

```
qevercloud::UserID quentier::Account::id ( ) const
```

##### Returns

User id for Evernote accounts, -1 for local accounts (as the concept of user id is not defined for local accounts)

#### 5.1.2.5 `isEmpty()`

```
bool quentier::Account::isEmpty ( ) const
```

##### Returns

True if either the account is local but the name is empty or if the account is Evernote but user id is negative; in all other cases return false

### 5.1.2.6 name()

```
QString quentier::Account::name ( ) const
```

#### Returns

Username for either local or Evernote account

### 5.1.2.7 print()

```
QTextStream & quentier::Account::print (
    QTextStream & strm ) const [override], [virtual]
```

Implements [quentier::Printable](#).

### 5.1.2.8 setDisplayName()

```
void quentier::Account::setDisplayName (
    QString displayName )
```

Set the printable name of the account

### 5.1.2.9 shardId()

```
QString quentier::Account::shardId ( ) const
```

#### Returns

Shard id for Evernote accounts, empty string for local accounts (as the concept of shard id is not defined for local accounts)

### 5.1.2.10 type()

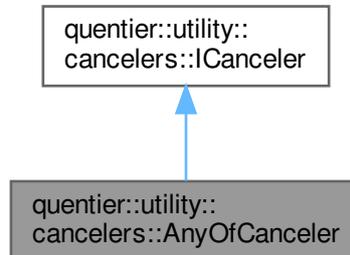

```
Type quentier::Account::type ( ) const
```

#### Returns

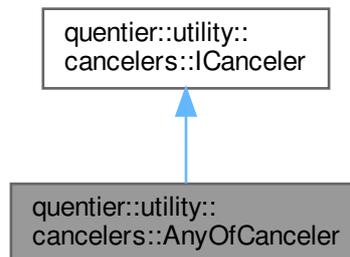

The type of the account: either local or Evernote

## 5.2 `quentier::utility::cancelers::AnyOfCanceler` Class Reference

Inheritance diagram for `quentier::utility::cancelers::AnyOfCanceler`:

Collaboration diagram for `quentier::utility::cancelers::AnyOfCanceler`:

### Public Member Functions

- `AnyOfCanceler` ([QList](#)< [ICancelerPtr](#) > cancelers)
- `AnyOfCanceler` ([AnyOfCanceler](#) &&other) `noexcept`
- `AnyOfCanceler` & `operator=` ([AnyOfCanceler](#) &&other) `noexcept`
- `bool isCanceled` () `const noexcept override`

### 5.2.1 Member Function Documentation

#### 5.2.1.1 `isCanceled()`

```
bool quentier::utility::cancelers::AnyOfCanceler::isCanceled ( ) const [override], [virtual], [noexcept]
```

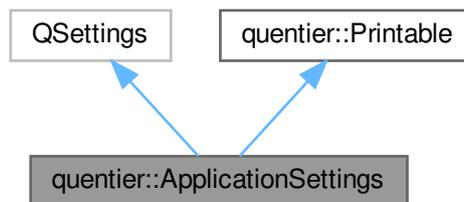

Implements [quentier::utility::cancelers::ICanceler](#).

### 5.3 `quentier::ApplicationSettings` Class Reference

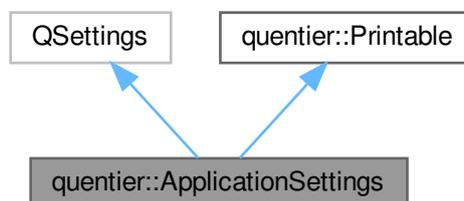

The [ApplicationSettings](#) class enhances the functionality of `QSettings`, in particular it simplifies the way of working with either application-wide or account-specific settings.

```
#include <ApplicationSettings.h>
```

Inheritance diagram for `quentier::ApplicationSettings`:

Collaboration diagram for `quentier::ApplicationSettings`:

#### Classes

- struct [ArrayCloser](#)
- struct [GroupCloser](#)

#### Public Member Functions

- [ApplicationSettings](#) (`const QString &settingsName={}`)
- [ApplicationSettings](#) (`const Account &account, const QString &settingsName={}`)
- [ApplicationSettings](#) (`const Account &account, const char *settingsName, int settingsNameSize=-1`)
- [ApplicationSettings](#) (`const Account &account, std::string_view settingsName`)
- `~ApplicationSettings ()` override
- `void beginGroup (const QString &prefix)`

- `void beginGroup (const char *prefix, int size=-1)`

- `int beginReadArray (std::string_view prefix)`
- `void beginWriteArray (const QString &prefix, int arraySize=-1)`
- `void beginWriteArray (const char *prefix, int arraySize=-1, int prefixSize=-1)`
- `void beginWriteArray (std::string_view prefix, int arraySize=-1)`
- `bool contains (const QString &key) const`
- `bool contains (const char *key, int size=-1) const`
- `bool contains (std::string_view key) const`
- `void remove (const QString &key)`
- `void remove (const char *key, int size=-1)`
- `void remove (std::string_view key)`
- `void setValue (const QString &key, const QVariant &value)`
- `void setValue (const char *key, const QVariant &value, int keySize=-1)`
- `void setValue (std::string_view key, const QVariant &value)`
- `QVariant value (const QString &key, const QVariant &defaultValue={}) const`
- `QVariant value (const char *key, const QVariant &defaultValue={}, int keySize=-1) const`
- `QVariant value (std::string_view key, const QVariant &defaultValue={}) const`
- `QDataStream & print (QDataStream &strm) const override`

## Public Member Functions inherited from `quentier::Printable`

- `QString toString () const`

### 5.3.1 Detailed Description

The `ApplicationSettings` class enhances the functionality of `QSettings`, in particular it simplifies the way of working with either application-wide or account-specific settings.

### 5.3.2 Constructor & Destructor Documentation

#### 5.3.2.1 `ApplicationSettings()` [1/4]

```
quentier::ApplicationSettings::ApplicationSettings (
    const QString & settingsName = {} ) [explicit]
```

Constructor for application settings not being account-specific

#### Parameters

<i>settingsName</i>	If not empty, the created application settings would manage the settings stored in a file with a specific name within the common settings storage; otherwise they would be stored in the default settings file for the account
---------------------	--

### 5.3.2.2 ApplicationSettings() [2/4]

```
quentier::ApplicationSettings::ApplicationSettings (
    const Account & account,
    const QString & settingsName = {} ) [explicit]
```

Constructor for application settings specific to the account

#### Parameters

<i>account</i>	The account for which the settings are to be stored or read
<i>settingsName</i>	If not empty, the created application settings would manage the settings stored in a file with a specific name within the account's settings storage; otherwise they would be stored in the default settings file for the account

### 5.3.2.3 ApplicationSettings() [3/4]

```
quentier::ApplicationSettings::ApplicationSettings (
    const Account & account,
    const char * settingsName,
    int settingsNameSize = -1 )
```

Constructor for application settings specific to the account

#### Parameters

<i>account</i>	The account for which the settings are to be stored or read
<i>settingsName</i>	If not nullptr, the created application settings would manage the settings stored in a file with a specific name within the account's settings storage; otherwise they would be stored in the default settings file for the account. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>settingsNameSize</i>	Size of the settingsName string. If negative (the default), the settingsName size is taken to be strlen(settingsName)

### 5.3.2.4 ApplicationSettings() [4/4]

```
quentier::ApplicationSettings::ApplicationSettings (
    const Account & account,
    std::string_view settingsName )
```

Constructor for application settings specific to the account

#### Parameters

<i>account</i>	The account for which the settings are to be stored or read
<i>settingsName</i>	If not empty, the created application settings would manage the settings stored in a file with a specific name within the account's settings storage; otherwise they would be stored in the default settings file for the account. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8

### 5.3.2.5 ~ApplicationSettings()

```
quentier::ApplicationSettings::~~ApplicationSettings ( ) [override]
```

Destructor

## 5.3.3 Member Function Documentation

### 5.3.3.1 beginGroup() [1/3]

```
void quentier::ApplicationSettings::beginGroup (
    const char * prefix,
    int size = -1 )
```

Appends prefix to the current group. Overload of beginGroup accepting const char \* and optionally the size of the string

Parameters

<i>prefix</i>	String containing the prefix name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>size</i>	Size of the prefix string. If negative (the default), the prefix size is taken to be strlen(prefix).

### 5.3.3.2 beginGroup() [2/3]

```
void quentier::ApplicationSettings::beginGroup (
    const QString & prefix )
```

Appends prefix to the current group. The call is redirected to QSettings::beginGroup. It is required in this class only to workaround hiding QSettings method due to overloads

Parameters

<i>prefix</i>	String containing the prefix name
---------------	-----------------------------------

### 5.3.3.3 beginGroup() [3/3]

```
void quentier::ApplicationSettings::beginGroup (
    std::string_view prefix )
```

Appends prefix to the current group. Overload of beginGroup accepting std::string\_view

Parameters

<i>prefix</i>	String containing the prefix name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>size</i>	Size of the prefix string. If negative (the default), the prefix size is taken to be strlen(prefix).

**5.3.3.4 beginReadArray() [1/3]**

```
int quentier::ApplicationSettings::beginReadArray (
    const char * prefix,
    int size = -1 )
```

Adds prefix to the current group and starts reading from an array. Overload of beginReadArray accepting const char \* and optionally the size of the string

**Parameters**

<i>prefix</i>	String containing the prefix name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>size</i>	Size of the prefix string. If negative (the default), the prefix size is taken to be strlen(prefix)

**5.3.3.5 beginReadArray() [2/3]**

```
int quentier::ApplicationSettings::beginReadArray (
    const QString & prefix )
```

Adds prefix to the current group and starts reading from an array. The call is redirected to QSettings::beginReadArray. It is required in this class only to workaround hiding QSettings method due to overloads

**Parameters**

<i>prefix</i>	String containing the prefix name
---------------	-----------------------------------

**Returns**

The size of the array

**5.3.3.6 beginReadArray() [3/3]**

```
int quentier::ApplicationSettings::beginReadArray (
    std::string_view prefix )
```

Adds prefix to the current group and starts reading from an array. Overload of beginReadArray accepting std::string\_view

**Parameters**

<i>prefix</i>	String containing the prefix name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
---------------	---

**5.3.3.7 beginWriteArray() [1/3]**

```
void quentier::ApplicationSettings::beginWriteArray (
    const char * prefix,
```

```
int arraySize = -1,
int prefixSize = -1 )
```

Adds prefix to the current group and starts writing an array of size `arraySize`. Overload of `beginWriteArray` accepting `const char *` and optionally the size of the string

#### Parameters

<i>prefix</i>	String containing the prefix name. Must be UTF-8 encoded as internally it is converted to <code>QString</code> via <code>QString::fromUtf8</code>
<i>arraySize</i>	Size of the array to be written. If negative (the default), it is automatically determined based on the indexes of the entries written.
<i>prefixSize</i>	Size of the prefix string. If negative (the default), the prefix size is taken to be <code>strlen(prefix)</code>

#### 5.3.3.8 beginWriteArray() [2/3]

```
void quentier::ApplicationSettings::beginWriteArray (
    const QString & prefix,
    int arraySize = -1 )
```

Adds prefix to the current group and starts writing an array of size `arraySize`. The call is redirected to `QSettings::beginWriteArray`. It is required in this class only to workaround hiding `QSettings` method due to overloads

#### Parameters

<i>prefix</i>	String containing the prefix name
<i>arraySize</i>	Size of the array to be written. If negative (the default), it is automatically determined based on the indexes of the entries written.

#### 5.3.3.9 beginWriteArray() [3/3]

```
void quentier::ApplicationSettings::beginWriteArray (
    std::string_view prefix,
    int arraySize = -1 )
```

Adds prefix to the current group and starts writing an array of size `arraySize`. Overload of `beginWriteArray` accepting `std::string_view`

#### Parameters

<i>prefix</i>	String containing the prefix name. Must be UTF-8 encoded as internally it is converted to <code>QString</code> via <code>QString::fromUtf8</code>
<i>arraySize</i>	Size of the array to be written. If negative (the default), it is automatically determined based on the indexes of the entries written.

#### 5.3.3.10 contains() [1/3]

```
bool quentier::ApplicationSettings::contains (
```

```

    const char * key,
    int size = -1 ) const

```

Overload of contains accepting const char \* and optionally the size of the string

#### Parameters

<i>key</i>	String containing the setting name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>size</i>	Size of the key string. If negative (the default), the key size is taken to be strlen(key)

#### Returns

True if there exists a setting called key; false otherwise

#### 5.3.3.11 contains() [2/3]

```

bool quantier::ApplicationSettings::contains (
    const QString & key ) const

```

The call is redirected to QSettings::contains. It is required in this class only to workaround hiding QSettings method due to overloads

#### Parameters

<i>key</i>	The key being checked for presence
------------	------------------------------------

#### Returns

True if there exists a setting called key; false otherwise

#### 5.3.3.12 contains() [3/3]

```

bool quantier::ApplicationSettings::contains (
    std::string_view key ) const

```

Overload of contains accepting std::string\_view

#### Parameters

<i>key</i>	String containing the setting name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
------------	--

#### Returns

True if there exists a setting called key; false otherwise

**5.3.3.13** `print()`

```
QTextStream & quentier::ApplicationSettings::print (
    QTextStream & strm ) const [override], [virtual]
```

Implements [quentier::Printable](#).

**5.3.3.14** `remove()` [1/3]

```
void quentier::ApplicationSettings::remove (
    const char * key,
    int size = -1 )
```

Removes the setting key and any sub-settings of key. Overload of `remove` accepting `const char *` and optionally the size of the string

**Parameters**

<i>key</i>	String containing the setting name. Must be UTF-8 encoded as internally it is converted to <code>QString</code> via <code>QString::fromUtf8</code>
<i>size</i>	Size of the key string. If negative (the default), the key size is taken to be <code>stren(key)</code> .

**5.3.3.15** `remove()` [2/3]

```
void quentier::ApplicationSettings::remove (
    const QString & key )
```

Removes the setting key and any sub-settings of key. The call is redirected to `QSettings::remove`. It is required in this class only to workaround hiding `QSettings` method due to overloads

**Parameters**

<i>key</i>	String containing the setting name
------------	------------------------------------

**5.3.3.16** `remove()` [3/3]

```
void quentier::ApplicationSettings::remove (
    std::string_view key )
```

Removes the setting key and any sub-settings of key. Overload of `remove` accepting `std::string_view`

**Parameters**

<i>key</i>	String containing the setting name. Must be UTF-8 encoded as internally it is converted to <code>QString</code> via <code>QString::fromUtf8</code>
------------	--

**5.3.3.17 setValue()** [1/3]

```
void quentier::ApplicationSettings::setValue (
    const char * key,
    const QVariant & value,
    int keySize = -1 )
```

Sets the value of setting. Overload of setValue accepting const char \* and optionally the size of the string

**Parameters**

<i>key</i>	String containing the setting name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>value</i>	Value for setting key
<i>keySize</i>	Size of the key string. If negative (the default), the key size is taken to be strlen(key).

**5.3.3.18 setValue()** [2/3]

```
void quentier::ApplicationSettings::setValue (
    const QString & key,
    const QVariant & value )
```

Sets the value of setting. The call is redirected to QSettings::setValue. It is required in this class only to workaround hiding QSettings method due to overloads

**Parameters**

<i>key</i>	String containing the setting name
<i>value</i>	Value for setting key

**5.3.3.19 setValue()** [3/3]

```
void quentier::ApplicationSettings::setValue (
    std::string_view key,
    const QVariant & value )
```

Sets the value of setting. Overload of setValue accepting std::string\_view

**Parameters**

<i>key</i>	String containing the setting name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>value</i>	Value for setting key

**5.3.3.20 value()** [1/3]

```
QVariant quentier::ApplicationSettings::value (
    const char * key,
```

```
const QVariant & defaultValue = {},
int keySize = -1 ) const
```

Fetches the value of setting. Overload of value accepting const char \* and optionally the size of the string

#### Parameters

<i>key</i>	String containing the setting name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>defaultValue</i>	Default value returned if the setting doesn't exist
<i>keySize</i>	Size of the key string. If negative (the default), the key size is taken to be strlen(key)

#### Returns

The value for setting key. If the setting doesn't exist, returns defaultValue. If no default value is specified, a default QVariant is returned.

#### 5.3.3.21 value() [2/3]

```
QVariant quentier::ApplicationSettings::value (
    const QString & key,
    const QVariant & defaultValue = {} ) const
```

Fetches the value of setting. The call is redirected to QSettings::value. It is required in this class only to workaround hiding QSettings method due to overloads

#### Parameters

<i>key</i>	String containing the setting name
<i>defaultValue</i>	Default value returned if the setting doesn't exist

#### Returns

The value for setting key. If the setting doesn't exist, returns defaultValue. If no default value is specified, a default QVariant is returned.

#### 5.3.3.22 value() [3/3]

```
QVariant quentier::ApplicationSettings::value (
    std::string_view key,
    const QVariant & defaultValue = {} ) const
```

Fetches the value of setting. Overload of value accepting std::string\_view

#### Parameters

<i>key</i>	String containing the setting name. Must be UTF-8 encoded as internally it is converted to QString via QString::fromUtf8
<i>defaultValue</i>	Default value returned if the setting doesn't exist

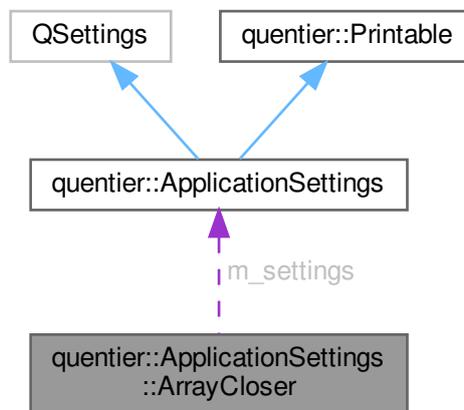

**Returns**

The value for setting key. If the setting doesn't exist, returns defaultValue. If no default value is specified, a default QVariant is returned.

## 5.4 quantier::ApplicationSettings::ArrayCloser Struct Reference

```
#include <ApplicationSettings.h>
```

Collaboration diagram for quantier::ApplicationSettings::ArrayCloser:

**Public Member Functions**

- **ArrayCloser** ([ApplicationSettings](#) &settings)

**Public Attributes**

- [ApplicationSettings](#) & **m\_settings**

### 5.4.1 Detailed Description

Helper struct for RAII style of ensuring the array once began would be closed even if exception is thrown after beginning the array

## 5.5 quantier::synchronization::AuthenticationExpiredError Struct Reference

```
#include <Errors.h>
```

### 5.5.1 Detailed Description

Authentication expired error indicates that used authentication token has expired so authentication should be repeated before the next attempt to run synchronization.

## 5.6 `quentier::synchronization::ISyncConflictResolver::ConflictResolution` Struct Reference

The `ConflictResolution` struct is a namespace inside which several other structs determining actual conflict resolutions.

```
#include <ISyncConflictResolver.h>
```

### Classes

- struct `IgnoreMine`  
*The `IgnoreMine` conflict resolution means "use theirs version and ignore mine version as it doesn't really conflict with theirs version".*
- struct `MoveMine`  
*The `MoveMine` conflict resolution means "before using theirs version change mine version as specified". Note: the data item inside this conflict resolution might refer to something different than mine version passed to the conflict resolution function. It can be that way because the actual conflict might be with another local data item instead of the passed one.*
- struct `UseMine`  
*The `UseMine` conflict resolution means "override theirs version with mine version".*
- struct `UseTheirs`  
*The `UseTheirs` conflict resolution means "override mine version with theirs version".*

### 5.6.1 Detailed Description

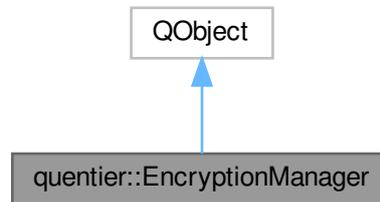

The `ConflictResolution` struct is a namespace inside which several other structs determining actual conflict resolutions.

## 5.7 `quentier::EncryptionManager` Class Reference

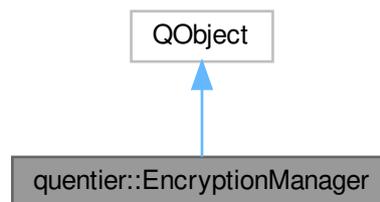

The `EncryptionManager` class provides both synchronous methods to encrypt or decrypt given text with password, cipher and key length and their signal-slot based potentially asynchronous counterparts.

```
#include <EncryptionManager.h>
```

Inheritance diagram for `quentier::EncryptionManager`:

Collaboration diagram for `quentier::EncryptionManager`:

### Public Slots

- `void onDecryptTextRequest` ([QString](#) encryptedText, [QString](#) passphrase, [QString](#) cipher, [size\\_t](#) keyLength, [QUuid](#) requestId)
- `void onEncryptTextRequest` ([QString](#) textToEncrypt, [QString](#) passphrase, [QString](#) cipher, [size\\_t](#) keyLength, [QUuid](#) requestId)

### Signals

- `void decryptedText` ([QString](#) text, [bool](#) success, [ErrorString](#) errorDescription, [QUuid](#) requestId)
- `void encryptedText` ([QString](#) encryptedText, [bool](#) success, [ErrorString](#) errorDescription, [QUuid](#) requestId)

### Public Member Functions

- `EncryptionManager` ([QObject](#) \*parent=nullptr)
- `bool decrypt` ([const QString](#) &encryptedText, [const QString](#) &passphrase, [const QString](#) &cipher, [size\\_t](#) keyLength, [QString](#) &decryptedText, [ErrorString](#) &errorDescription)
- `bool encrypt` ([const QString](#) &textToEncrypt, [const QString](#) &passphrase, [QString](#) &cipher, [size\\_t](#) &keyLength, [QString](#) &encryptedText, [ErrorString](#) &errorDescription)

### 5.7.1 Detailed Description

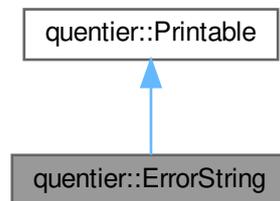

The `EncryptionManager` class provides both synchronous methods to encrypt or decrypt given text with password, cipher and key length and their signal-slot based potentially asynchronous counterparts.

## 5.8 `quentier::ErrorString` Class Reference

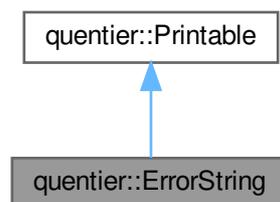

The `ErrorString` class encapsulates two (or more) strings which are meant to contain translatable (base) and non-translatable (details) parts of the error description.

```
#include <ErrorString.h>
```

Inheritance diagram for `quentier::ErrorString`:

Collaboration diagram for `quentier::ErrorString`:

### Public Member Functions

- `ErrorString` (`const char *error=nullptr`)
- `ErrorString` (`const QString &error`)
- `ErrorString` (`const ErrorString &other`)
- `ErrorString` (`ErrorString &&other`) `noexcept`
- `ErrorString & operator=` (`const ErrorString &other`)

- [ErrorString](#) & **operator=** ([ErrorString](#) &&[other](#)) noexcept
- [const QString](#) & **base** () const noexcept
- [QString](#) & **base** ()
- [const QStringList](#) & **additionalBases** () const noexcept
- [QStringList](#) & **additionalBases** ()
- [const QString](#) & **details** () const noexcept
- [QString](#) & **details** ()
- [void](#) **setBase** ([QString](#) error)
- [void](#) **setBase** (const char \*error)
- [void](#) **appendBase** (const [QString](#) &error)
- [void](#) **appendBase** (const [QStringList](#) &errors)
- [void](#) **appendBase** (const char \*error)
- [void](#) **setDetails** (const [QString](#) &error)
- [void](#) **setDetails** (const char \*error)
- [bool](#) **isEmpty** () const
- [void](#) **clear** ()
- [QString](#) **localizedString** () const
- [QString](#) **nonLocalizedString** () const
- [QTextStream](#) & **print** ([QTextStream](#) &strm) const override

## Public Member Functions inherited from [quentier::Printable](#)

- [QString](#) **toString** () const

### 5.8.1 Detailed Description

The [ErrorString](#) class encapsulates two (or more) strings which are meant to contain translatable (base) and non-translatable (details) parts of the error description.

1. `base()` methods return const and non-const links to the primary translatable string
2. `details()` methods return const and non-const links to non-translatable string (coming from some third party library etc)
3. `additionalBases()` methods return const and non-const links to additional translatable strings; one translatable string is not always enough because the error message might be composed from different parts

### 5.8.2 Member Function Documentation

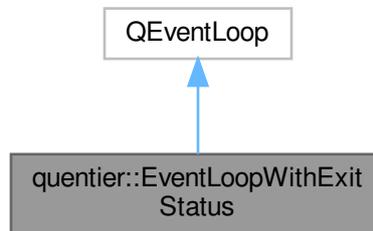

#### 5.8.2.1 `print()`

```
QTextStream & quentier::ErrorString::print (
    QTextStream & strm ) const [override], [virtual]
```

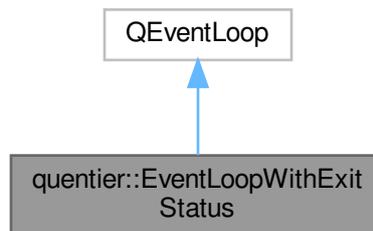

Implements [quentier::Printable](#).

## 5.9 `quentier::EventLoopWithExitStatus` Class Reference

Inheritance diagram for `quentier::EventLoopWithExitStatus`:

Collaboration diagram for `quentier::EventLoopWithExitStatus`:

### Public Types

- enum class `ExitStatus` { `Success` , `Failure` , `Timeout` }

### Public Slots

- `void exitAsSuccess ()`
- `void exitAsFailure ()`
- `void exitAsFailureWithError (QString errorDescription)`
- `void exitAsFailureWithErrorString (ErrorString errorDescription)`
- `void exitAsTimeout ()`

### Public Member Functions

- `EventLoopWithExitStatus (QObject *parent=nullptr)`
- `ExitStatus exitStatus () const`
- `const ErrorString & errorDescription () const`

**Friends**

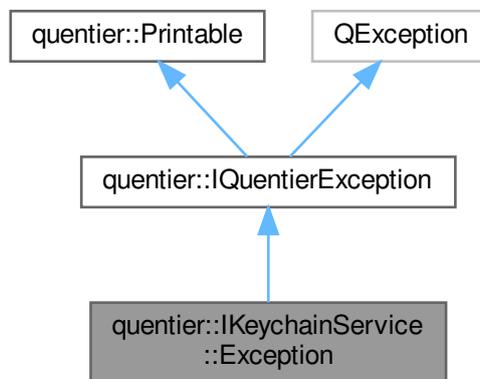

- `QDebug` & `operator<<` (`QDebug` &`dbg`, `ExitStatus` `status`)
- `QTextStream` & `operator<<` (`QTextStream` &`strm`, `ExitStatus` `status`)

**5.10 quentier::IKeychainService::Exception Class Reference**

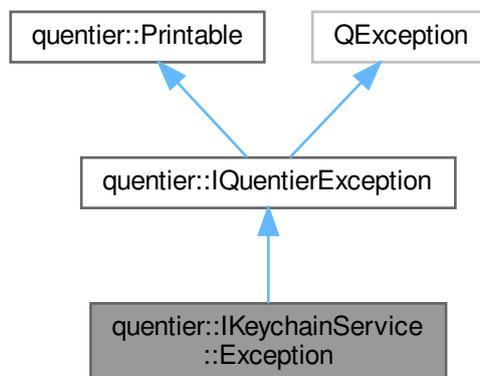

The `IKeychainService::Exception` class is the base class for exceptions returned inside `QFutures` from methods of `IKeychainService`.

```
#include <IKeychainService.h>
```

Inheritance diagram for `quentier::IKeychainService::Exception`:

Collaboration diagram for `quentier::IKeychainService::Exception`:

## Public Member Functions

- **Exception** (`ErrorCode` errorCode) `noexcept`
- **Exception** (`ErrorCode` errorCode, `ErrorString` errorDescription) `noexcept`
- `ErrorCode` **errorCode** () `const noexcept`
- `QString` **exceptionDisplayName** () `const override`
- `void` **raise** () `const override`
- `Exception` \* **clone** () `const override`

## Public Member Functions inherited from `quentier::IQuentierException`

- `ErrorString` **errorMessage** () `const`
- `QString` **localizedErrorMessage** () `const`
- `QString` **nonLocalizedErrorMessage** () `const`
- `const char` \* **what** () `const noexcept override`
- `QTextStream` & **print** (`QTextStream` &strm) `const override`

## Public Member Functions inherited from `quentier::Printable`

- `QString` **toString** () `const`

## Additional Inherited Members

## Protected Member Functions inherited from `quentier::IQuentierException`

- `IQuentierException` (`ErrorString` message)
- `IQuentierException` (`const IQuentierException` &other)
- `IQuentierException` & **operator=** (`const IQuentierException` &other)

### 5.10.1 Detailed Description

The `IKeychainService::Exception` class is the base class for exceptions returned inside `QFutures` from methods of `IKeychainService`.

### 5.10.2 Member Function Documentation

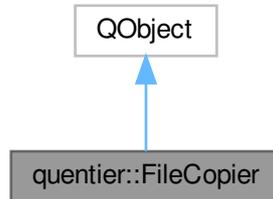

#### 5.10.2.1 `exceptionDisplayName()`

```
QString quentier::IKeychainService::Exception::exceptionDisplayName ( ) const [override],  
[virtual]
```

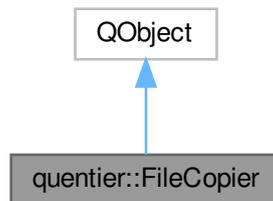

Implements `quentier::IQuentierException`.

## 5.11 quantier::FileCopier Class Reference

Inheritance diagram for quantier::FileCopier:

Collaboration diagram for quantier::FileCopier:

### Public Types

- enum class **State** { **Idle** = 0 , **Copying** , **Cancelling** }

### Public Slots

- [void copyFile](#) ([QString sourcePath](#), [QString destPath](#))
- [void cancel](#) ()

### Signals

- [void progressUpdate](#) ([double progress](#))
- [void finished](#) ([QString sourcePath](#), [QString destPath](#))
- [void cancelled](#) ([QString sourcePath](#), [QString destPath](#))
- [void notifyError](#) ([ErrorString error](#))

### Public Member Functions

- **FileCopier** (QObject \*parent=nullptr)
- State **state** () const
- QString **sourceFilePath** () const
- QString **destinationFilePath** () const
- double **currentProgress** () const

### Friends

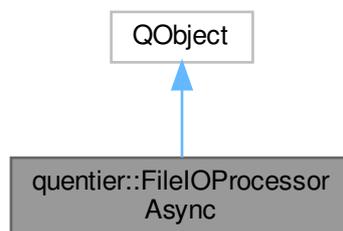

- QDebug & **operator**<< (QDebug &dbg, State state)
- QTextStream & **operator**<< (QTextStream &strm, State state)

## 5.12 quantier::FileIOProcessorAsync Class Reference

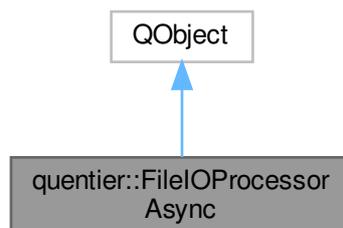

The [FileIOProcessorAsync](#) class is a wrapper under simple file IO operations, it is meant to be used for simple asynchronous IO.

```
#include <FileIOProcessorAsync.h>
```

Inheritance diagram for quantier::FileIOProcessorAsync:

Collaboration diagram for quantier::FileIOProcessorAsync:

## Public Slots

- `void onWriteFileRequest (QString absoluteFilePath, QByteArray data, QUuid requestId, bool append)`  
*onWriteFileRequest slot processes file write requests with given request ids*
- `void onReadFileRequest (QString absoluteFilePath, QUuid requestId)`  
*onReadFileRequest slot processes file read requests with given request ids*

## Signals

- `void readyForIO ()`  
*readyForIO signal is emitted when the queue for file IO is empty for some time (30 seconds by default, can also be configured via `setIdleTimePeriod` method) after the last IO event to signal listeners that they can perform some IO via the `FileIOProcessorAsync`*
- `void writeFileRequestProcessed (bool success, ErrorString errorDescription, QUuid requestId)`  
*writeFileRequestProcessed signal is emitted when the file write request with given id is finished*
- `void readFileRequestProcessed (bool success, ErrorString errorDescription, QByteArray data, QUuid requestId)`  
*readFileRequestProcessed signal is emitted when the file read request with given id is finished*

## Public Member Functions

- `FileIOProcessorAsync (QObject *parent=nullptr)`
- `void setIdleTimePeriod (qint32 seconds)`  
*setIdleTimePeriod sets time period defining the idle state of `FileIOProcessorAsync`: once the time measured since the last IO operation is over the specified number of seconds, the class emits `readyForIO` signal to any interested listeners of this event. If this method is not called ever, the default idle time period would be 30 seconds.*

### 5.12.1 Detailed Description

The `FileIOProcessorAsync` class is a wrapper under simple file IO operations, it is meant to be used for simple asynchronous IO.

### 5.12.2 Member Function Documentation

#### 5.12.2.1 onReadFileRequest

```
void quentier::FileIOProcessorAsync::onReadFileRequest (
    QString absoluteFilePath,
    QUuid requestId ) [slot]
```

`onReadFileRequest` slot processes file read requests with given request ids

#### Parameters

<code>absoluteFilePath</code>	Absolute file path to be read
<code>requestId</code>	Unique identifier of the file read request

### 5.12.2.2 onWriteFileRequest

```
void quotientier::FileIOProcessorAsync::onWriteFileRequest (
    QString absoluteFilePath,
    QByteArray data,
    QUuid requestId,
    bool append ) [slot]
```

onWriteFileRequest slot processes file write requests with given request ids

#### Parameters

<i>absoluteFilePath</i>	Absolute file path to be written
<i>data</i>	Data to be written to the file
<i>requestId</i>	Unique identifier of the file write request
<i>append</i>	If true, the data would be appended to file, otherwise the entire file would be erased before with the data is written

### 5.12.2.3 readFileRequestProcessed

```
void quotientier::FileIOProcessorAsync::readFileRequestProcessed (
    bool success,
    ErrorString errorDescription,
    QByteArray data,
    QUuid requestId ) [signal]
```

readFileRequestProcessed signal is emitted when the file read request with given id is finished

#### Parameters

<i>success</i>	True if read operation was successful, false otherwise
<i>errorDescription</i>	Textual description of the error
<i>data</i>	Data read from file
<i>requestId</i>	Unique identifier of the file read request

### 5.12.2.4 setIdleTimePeriod()

```
void quotientier::FileIOProcessorAsync::setIdleTimePeriod (
    qint32 seconds )
```

setIdleTimePeriod sets time period defining the idle state of [FileIOProcessorAsync](#): once the time measured since the last IO operation is over the specified number of seconds, the class emits readyForIO signal to any interested listeners of this event. If this method is not called ever, the default idle time period would be 30 seconds.

#### Parameters

<i>seconds</i>	Number of seconds for idle time period
----------------	--

### 5.12.2.5 writeFileRequestProcessed

```
void quentier::FileIOProcessorAsync::writeFileRequestProcessed (
    bool success,
    QString errorDescription,
    QUuid requestId ) [signal]
```

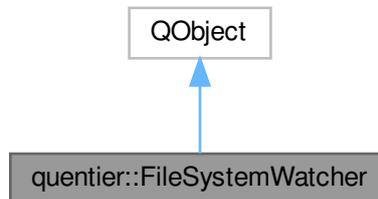

writeFileRequestProcessed signal is emitted when the file write request with given id is finished

#### Parameters

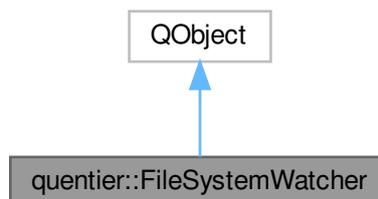

<i>success</i>	True if write operation was successful, false otherwise
<i>errorDescription</i>	Textual description of the error
<i>requestId</i>	Unique identifier of the file write request

## 5.13 quentier::FileSystemWatcher Class Reference

Inheritance diagram for quentier::FileSystemWatcher:

Collaboration diagram for quentier::FileSystemWatcher:

## Signals

- `void directoryChanged (const QString &path)`
- `void directoryRemoved (const QString &path)`
- `void fileChanged (const QString &path)`
- `void fileRemoved (const QString &path)`

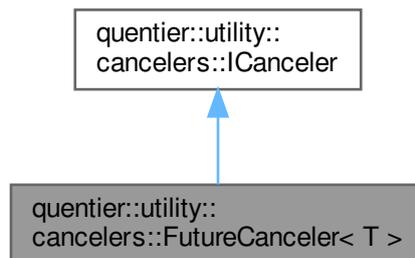

## Public Member Functions

- `FileSystemWatcher (int removalTimeoutMSec=FILE_SYSTEM_WATCHER_DEFAULT_REMOVAL_TIMEOUT_MSEC, QObject *parent=nullptr)`
- `FileSystemWatcher (const QStringList &paths, int removalTimeoutMSec=FILE_SYSTEM_WATCHER_DEFAULT_REMOVAL_TIMEOUT_MSEC, QObject *parent=nullptr)`
- `void addPath (const QString &path)`
- `void addPaths (const QStringList &paths)`
- `QStringList directories () const`
- `QStringList files () const`
- `void removePath (const QString &path)`
- `void removePaths (const QStringList &paths)`

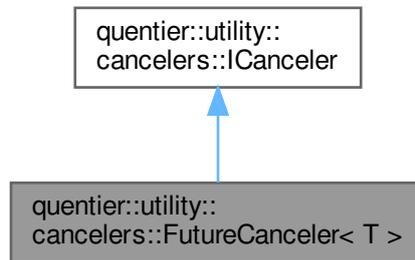

## 5.14 `quentier::utility::cancelers::FutureCanceler< T >` Class Template Reference

```
#include <FutureCanceler.h>
```

Inheritance diagram for `quentier::utility::cancelers::FutureCanceler< T >`:

Collaboration diagram for `quentier::utility::cancelers::FutureCanceler< T >`:

### Public Member Functions

- `FutureCanceler` (`QFuture< T > future`)
- `bool isCanceled () const noexcept override`

#### 5.14.1 Detailed Description

```

template<class T>
class quentier::utility::cancelers::FutureCanceler< T >
  
```

`ICanceler` implementation which tracks the canceled status of a future.

#### 5.14.2 Member Function Documentation

##### 5.14.2.1 `isCanceled()`

```

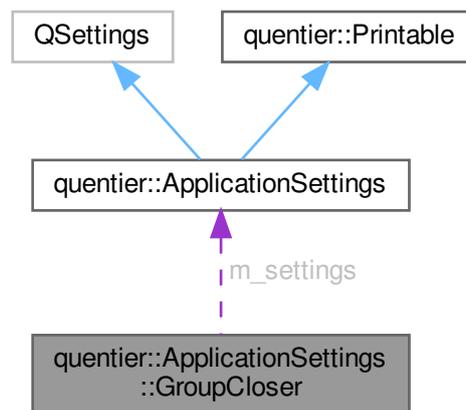

template<class T >
bool quentier::utility::cancelers::FutureCanceler< T >::isCanceled ( ) const [inline], [override],
[virtual], [noexcept]
  
```

Implements `quentier::utility::cancelers::ICanceler`.

## 5.15 `quentier::ApplicationSettings::GroupCloser` Struct Reference

```
#include <ApplicationSettings.h>
```

Collaboration diagram for `quentier::ApplicationSettings::GroupCloser`:

### Public Member Functions

- `GroupCloser` ([ApplicationSettings](#) &[settings](#))

### Public Attributes

- [ApplicationSettings](#) & `m_settings`

### 5.15.1 Detailed Description

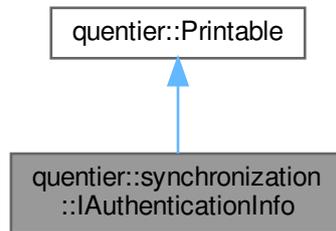

Helper struct for RAII style of ensuring the group once opened would be closed even if exception is thrown after beginning the group

## 5.16 `quentier::synchronization::IAuthenticationInfo` Class Reference

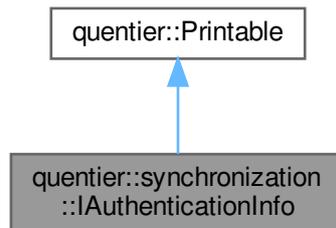

The [IAuthenticationInfo](#) interface represents the information obtained through OAuth and necessary to access Evernote API.

```
#include <IAuthenticationInfo.h>
```

Inheritance diagram for `quentier::synchronization::IAuthenticationInfo`:

Collaboration diagram for `quentier::synchronization::IAuthenticationInfo`:

### Public Member Functions

- `virtual` `qevercloud::UserID` `userId () const =0`
- `virtual` `QString` `authToken () const =0`
- `virtual` `qevercloud::Timestamp` `authTokenExpirationTime () const =0`
- `virtual` `qevercloud::Timestamp` `authenticationTime () const =0`
- `virtual` `QString` `shardId () const =0`
- `virtual` `QString` `noteStoreUrl () const =0`
- `virtual` `QString` `webApiUrlPrefix () const =0`
- `virtual` `QList< QNetworkCookie >` `userStoreCookies () const =0`

### Public Member Functions inherited from `quentier::Printable`

- `virtual` `QTextStream` & `print (QTextStream &strm) const =0`
- `QString` `toString () const`

## 5.16.1 Detailed Description

The [IAuthenticationInfo](#) interface represents the information obtained through OAuth and necessary to access Evernote API.

## 5.16.2 Member Function Documentation

### 5.16.2.1 authenticationTime()

```
virtual qevercloud::Timestamp quentier::synchronization::IAuthenticationInfo::authentication←  
Time ( ) const [pure virtual]
```

Timestamp at which authentication info was received from Evernote

### 5.16.2.2 authToken()

```
virtual QString quentier::synchronization::IAuthenticationInfo::authToken ( ) const [pure  
virtual]
```

Authentication token which needs to be used for access to Evernote API

### 5.16.2.3 authTokenExpirationTime()

```
virtual qevercloud::Timestamp quentier::synchronization::IAuthenticationInfo::authToken←  
ExpirationTime ( ) const [pure virtual]
```

Expiration timestamp for the authentication token

### 5.16.2.4 noteStoreUrl()

```
virtual QString quentier::synchronization::IAuthenticationInfo::noteStoreUrl ( ) const [pure  
virtual]
```

Url of the note store service for this user

### 5.16.2.5 shardId()

```
virtual QString quentier::synchronization::IAuthenticationInfo::shardId ( ) const [pure virtual]
```

Shard identifier which needs to be used for access to Evernote API along with the authentication token

### 5.16.2.6 userId()

```
virtual qevercloud::UserID quentier::synchronization::IAuthenticationInfo::userId ( ) const  
[pure virtual]
```

Identifier of the authenticated user

### 5.16.2.7 userStoreCookies()

```
virtual QList< QNetworkCookie > quentier::synchronization::IAuthenticationInfo::userStore←
Cookies ( ) const [pure virtual]
```

The list of network cookies received during OAuth procedure. Although is is not mentioned anywhere in Evernote docs, these cookies might have to be used for access to user store. See this discussion for reference: <https://discussion.evernote.com/forums/topic/124257-calls-to-userstore-from-evernote-api-stop>

### 5.16.2.8 webApiUrlPrefix()

```
virtual QString quentier::synchronization::IAuthenticationInfo::webApiUrlPrefix ( ) const
[pure virtual]
```

Url prefix for Evernote Web API.

See also

qevercloud::PublicUserInfo::webApiUrlPrefix

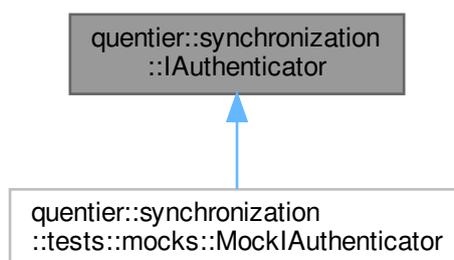

## 5.17 quentier::synchronization::IAuthenticationInfoBuilder Class Reference

### Public Member Functions

- [virtual IAuthenticationInfoBuilder & setUserId](#) (qevercloud::UserID userId)=0
- [virtual IAuthenticationInfoBuilder & setAuthToken](#) (QString token)=0
- [virtual IAuthenticationInfoBuilder & setAuthTokenExpirationTime](#) (qevercloud::Timestamp expirationTime)=0
- [virtual IAuthenticationInfoBuilder & setAuthenticationTime](#) (qevercloud::Timestamp authenticationTime)=0
- [virtual IAuthenticationInfoBuilder & setShardId](#) (QString shardId)=0
- [virtual IAuthenticationInfoBuilder & setNoteStoreUrl](#) (QString noteStoreUrl)=0
- [virtual IAuthenticationInfoBuilder & setWebApiUrlPrefix](#) (QString webApiUrlPrefix)=0
- [virtual IAuthenticationInfoBuilder & setUserStoreCookies](#) (QList< QNetworkCookie > cookies)=0
- [virtual IAuthenticationInfoPtr build](#) ()=0

## 5.18 quentier::synchronization::IAuthenticator Class Reference

Inheritance diagram for quentier::synchronization::IAuthenticator:

**Public Member Functions**

- `virtual QFuture< IAuthenticationInfoPtr > authenticateNewAccount ()=0`
- `virtual QFuture< IAuthenticationInfoPtr > authenticateAccount (Account account)=0`

## 5.19 `quentier::ResourceRecognitionIndexItem::IBarcodeItem` Struct Reference

**Public Member Functions**

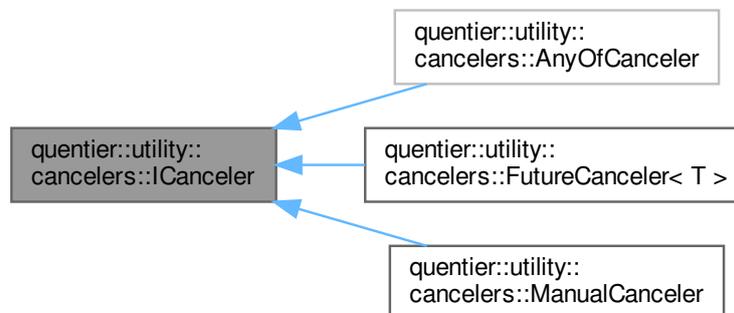

- `virtual QString barcode () const =0`
- `virtual int weight () const =0`

## 5.20 `quentier::utility::cancelers::ICanceler` Class Reference

The `ICanceler` interface provides `isCanceled` method which can be used to check whether some processing can be skipped because it was canceled.

```
#include <ICanceler.h>
```

Inheritance diagram for `quentier::utility::cancelers::ICanceler`:

**Public Member Functions**

- `virtual bool isCanceled () const =0`

### 5.20.1 Detailed Description

The `ICanceler` interface provides `isCanceled` method which can be used to check whether some processing can be skipped because it was canceled.

## 5.21 quotientier::enml::IConverter Class Reference

The [IConverter](#) interface encapsulates a set of methods performing conversions between ENML and other note content formats, namely HTML.

```
#include <IConverter.h>
```

### Public Types

- enum class [EnexExportTags](#) { **Yes** = 0 , **No** }

*The [EnexExportTags](#) enum allows to specify whether export of note(s) to ENEX should include the names of note's tags or not.*

### Public Member Functions

- virtual [Result](#)< [QString](#), [ErrorString](#) > [convertHtmlToEnml](#) (const [QString](#) &html, [IDecryptedTextCache](#) &decryptedTextCache, const [QList](#)< [conversion\\_rules::ISkipRulePtr](#) > &skipRules={}) const =0
- virtual [Result](#)< void, [ErrorString](#) > [convertHtmlToDoc](#) (const [QString](#) &html, [QTextDocument](#) &doc, const [QList](#)< [conversion\\_rules::ISkipRulePtr](#) > &skipRules={}) const =0
- virtual [Result](#)< [QString](#), [ErrorString](#) > [convertHtmlToXml](#) (const [QString](#) &html) const =0
- virtual [Result](#)< [QString](#), [ErrorString](#) > [convertHtmlToXhtml](#) (const [QString](#) &html) const =0
- virtual [Result](#)< [IHtmlDataPtr](#), [ErrorString](#) > [convertEnmlToHtml](#) (const [QString](#) &enml, [IDecryptedTextCache](#) &decryptedTextCache) const =0
- virtual [Result](#)< [QString](#), [ErrorString](#) > [convertEnmlToPlainText](#) (const [QString](#) &enml) const =0
- virtual [Result](#)< [QStringList](#), [ErrorString](#) > [convertEnmlToWordsList](#) (const [QString](#) &enml) const =0
- virtual [QStringList](#) [convertPlainTextToWordsList](#) (const [QString](#) &plainText) const =0
- virtual [Result](#)< void, [ErrorString](#) > [validateEnml](#) (const [QString](#) &enml) const =0
- virtual [Result](#)< [QString](#), [ErrorString](#) > [validateAndFixupEnml](#) (const [QString](#) &enml) const =0
- virtual [Result](#)< [QString](#), [ErrorString](#) > [exportNotesToEnex](#) (const [QList](#)< [qevercloud::Note](#) > &notes, const [QHash](#)< [QString](#), [QString](#) > &tagNamesByTagLocalIds, [EnexExportTags](#) exportTagsOption, const [QString](#) &version={}) const =0
- virtual [Result](#)< [QList](#)< [qevercloud::Note](#) >, [ErrorString](#) > [importEnex](#) (const [QString](#) &enex) const =0

### 5.21.1 Detailed Description

The [IConverter](#) interface encapsulates a set of methods performing conversions between ENML and other note content formats, namely HTML.

### 5.21.2 Member Function Documentation

#### 5.21.2.1 convertEnmlToHtml()

```
virtual Result< IHtmlDataPtr, ErrorString > quotientier::enml::IConverter::convertEnmlToHtml (
    const QString & enml,
    IDecryptedTextCache & decryptedTextCache ) const [pure virtual]
```

Converts ENML into HTML representation of note content

## Parameters

<i>enml</i>	ENML representation of note content
<i>decryptedTextCache</i>	cache of decrypted text fragments

## Returns

[Result](#) with HTML data in case of success or error string in case of failure

**5.21.2.2 convertEnmlToPlainText()**

```
virtual Result< QString, ErrorString > quantier::enml::IConverter::convertEnmlToPlainText (
    const QString & enml ) const [pure virtual]
```

Converts ENML into plain text representation of note content

## Parameters

<i>enml</i>	ENML representation of note content
-------------	-------------------------------------

## Returns

[Result](#) with plain text representation of note content in case of success or error string in case of failure

**5.21.2.3 convertEnmlToWordsList()**

```
virtual Result< QStringList, ErrorString > quantier::enml::IConverter::convertEnmlToWordsList (
    const QString & enml ) const [pure virtual]
```

Converts ENML into a list of words

## Parameters

<i>enml</i>	ENML representation of note content
-------------	-------------------------------------

## Returns

[Result](#) with list of words in case of success or error string in case of failure

**5.21.2.4 convertHtmlToDoc()**

```
virtual Result< void, ErrorString > quantier::enml::IConverter::convertHtmlToDoc (
    const QString & html,
    QTextDocument & doc,
```

```
    const QList< conversion_rules::ISkipRulePtr > & skipRules = {} ) const [pure  
virtual]
```

Convert HTML representation of note content into QTextDocument

## Parameters

<i>html</i>	HTML representation of note content
<i>doc</i>	QTextDocument into which the converted note content is put
<i>skipRules</i>	skip rules to be used during the conversion

## Returns

Valid result in case of success or error string in case of failure

## 5.21.2.5 convertHtmlToEnml()

```
virtual Result< QString, ErrorString > quotientier::enml::IConverter::convertHtmlToEnml (
    const QString & html,
    IDecryptedTextCache & decryptedTextCache,
    const QList< conversion_rules::ISkipRulePtr > & skipRules = {} ) const [pure
virtual]
```

Converts HTML representation of note content into ENML

## Parameters

<i>html</i>	HTML representation of note content
<i>decryptedTextCache</i>	cache of decrypted text fragments
<i>skipRules</i>	skip rules to be used during the conversion

## Returns

[Result](#) with ENML in case of success or error string in case of failure

## 5.21.2.6 convertHtmlToXhtml()

```
virtual Result< QString, ErrorString > quotientier::enml::IConverter::convertHtmlToXhtml (
    const QString & html ) const [pure virtual]
```

Convert HTML representation of note content into a valid XHTML document

## Parameters

<i>html</i>	HTML representation of note content
-------------	-------------------------------------

## Returns

[Result](#) with XHTML in case of success or error string in case of failure

### 5.21.2.7 convertHtmlToXml()

```
virtual Result< QString, ErrorString > quentier::enml::IConverter::convertHtmlToXml (
    const QString & html ) const [pure virtual]
```

Convert HTML representation of note content into a valid XML document

#### Parameters

<i>html</i>	HTML representation of note content
-------------	-------------------------------------

#### Returns

[Result](#) with XML in case of success of error string in case of failure

### 5.21.2.8 convertPlainTextToWordsList()

```
virtual QStringList quentier::enml::IConverter::convertPlainTextToWordsList (
    const QString & plainText ) const [pure virtual]
```

Converts plain text into a list of words

#### Parameters

<i>plainText</i>	plain text representation of note content
------------------	---

#### Returns

list of words

### 5.21.2.9 exportNotesToEnex()

```
virtual Result< QString, ErrorString > quentier::enml::IConverter::exportNotesToEnex (
    const QList< qevercloud::Note > & notes,
    const QHash< QString, QString > & tagNameByTagLocalIds,
    EnexExportTags exportTagsOption,
    const QString & version = {} ) const [pure virtual]
```

Exports a list of notes into ENEX

#### Parameters

<i>notes</i>	notes to be exported into ENEX
<i>tagNameByTagLocalIds</i>	mapper from tag local ids into tag names
<i>exportTagsOption</i>	option controlling the export of tag names
<i>version</i>	optional version tag for ENEX, omitted if not set

**Returns**

[Result](#) with ENEX in case of success or error string in case of failure

**5.21.2.10 importEnex()**

```
virtual Result< QList< qevercloud::Note >, ErrorString > quotientier::enml::IConverter::importEnex (
    const QString & enex ) const [pure virtual]
```

Import notes from ENEX

**Parameters**

<i>enex</i>	ENEX to be used for import
-------------	----------------------------

**Returns**

[Result](#) with list of notes in case of success or error string in case of failure

**Note**

if tag names are present in ENEX, corresponding notes would have their tagNames field filled

**5.21.2.11 validateAndFixupEnml()**

```
virtual Result< QString, ErrorString > quotientier::enml::IConverter::validateAndFixupEnml (
    const QString & enml ) const [pure virtual]
```

Validates ENML and attempts to fix it automatically if it's not valid

**Parameters**

<i>enml</i>	ENML representation of note content
-------------	-------------------------------------

**Returns**

[Result](#) with either unchanged or fixed up ENML in case of success or error string in case of failure

**5.21.2.12 validateEnml()**

```
virtual Result< void, ErrorString > quotientier::enml::IConverter::validateEnml (
    const QString & enml ) const [pure virtual]
```

Validates ENML against rules

## Parameters

<i>enml</i>	ENML representation of note content
-------------	-------------------------------------

## Returns

valid [Result](#) in case of success or error string in case of failure

## 5.22 quantier::enml::IDecryptedTextCache Class Reference

## Public Types

## 5.25 `quentier::enml::IENMLTagsConverter` Class Reference

The `IENMLTagsConverter` interfaces provides methods which convert Evernote-specific markup tags such as `en-crypt`, `en-media` etc. into their counterparts which should be used in the HTML representation of note content.

```
#include <IENMLTagsConverter.h>
```

### Public Member Functions

- `virtual QString convertEnToDo (bool checked, quint32 index) const =0`
- `virtual QString convertEncryptedText (const QString &encryptedText, const QString &hint, const QString &cipher, std::size_t keyLength, quint32 index) const =0`
- `virtual QString convertDecryptedText (const QString &decryptedText, const QString &encryptedText, const QString &hint, const QString &cipher, std::size_t keyLength, quint32 index) const =0`
- `virtual Result< QString, ErrorString > convertResource (const qevercloud::Resource &resource) const =0`

### 5.25.1 Detailed Description

The `IENMLTagsConverter` interfaces provides methods which convert Evernote-specific markup tags such as `en-crypt`, `en-media` etc. into their counterparts which should be used in the HTML representation of note content.

### 5.25.2 Member Function Documentation

#### 5.25.2.1 `convertDecryptedText()`

```
virtual QString quentier::enml::IENMLTagsConverter::convertDecryptedText (
    const QString & decryptedText,
    const QString & encryptedText,
    const QString & hint,
    const QString & cipher,
    std::size_t keyLength,
    quint32 index ) const [pure virtual]
```

Converts already decrypted `en-crypt` tag into its HTML counterpart

#### Parameters

<i>decryptedText</i>	decrypted text from <code>en-crypt</code> tag
<i>encryptedText</i>	encrypted text contained within <code>en-crypt</code> tag
<i>hint</i>	hint to be displayed when user tries to decrypt the text
<i>cipher</i>	cipher used to encrypt the text
<i>keyLength</i>	length of the key used to encrypt the text
<i>index</i>	index of particular <code>en-crypt</code> tag within the note content so that different <code>en-crypt</code> tags can be differentiated

**Returns**

HTML representation of decrypted en-crypt tag

**5.25.2.2 convertEncryptedText()**

```
virtual QString quentier::enml::IENMLTagsConverter::convertEncryptedText (
    const QString & encryptedText,
    const QString & hint,
    const QString & cipher,
    std::size_t keyLength,
    quint32 index ) const [pure virtual]
```

Converts en-crypt tag into its HTML counterpart

**Parameters**

<i>encryptedText</i>	encrypted text contained within en-crypt tag
<i>hint</i>	hint to be displayed when user tries to decrypt the text
<i>cipher</i>	cipher used to encrypt the text
<i>keyLength</i>	length of the key used to encrypt the text
<i>index</i>	index of particular en-crypt tag within the note content so that different en-crypt tags can be differentiated

**Returns**

HTML representation of en-crypt tag

**5.25.2.3 convertEnToDo()**

```
virtual QString quentier::enml::IENMLTagsConverter::convertEnToDo (
    bool checked,
    quint32 index ) const [pure virtual]
```

Converts en-todo tag into its HTML counterpart

**Parameters**

<i>checked</i>	indicates whether this todo is checked or not
<i>index</i>	index of particular en-todo tag within the note content so that different todo tags can be differentiated

**Returns**

HTML representation of en-todo tag

**5.25.2.4 convertResource()**

```
virtual Result< QString, ErrorString > quentier::enml::IENMLTagsConverter::convertResource (
    const qevercloud::Resource & resource ) const [pure virtual]
```

Converts en-media tag representing a resource into its HTML counterpart

## Parameters

<i>resource</i>	resource corresponding to en-media tag
-----------------	--

## Returns

[Result](#) with valid HTML representing the resource/en-media tag in case of success or error string in case of failure

## 5.26 `quentier::synchronization::ISyncConflictResolver::ConflictResolution::IgnoreMine` Struct Reference ↔

The [IgnoreMine](#) conflict resolution means "use theirs version and ignore mine version as it doesn't really conflict with theirs version".

```
#include <ISyncConflictResolver.h>
```

### 5.26.1 Detailed Description

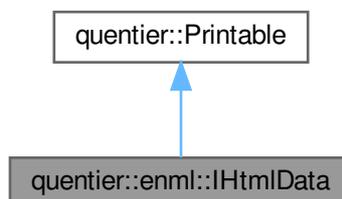

The [IgnoreMine](#) conflict resolution means "use theirs version and ignore mine version as it doesn't really conflict with theirs version".

## 5.27 `quentier::enml::IHtmlData` Struct Reference

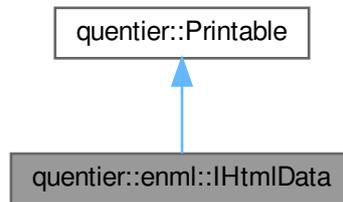

The [IHtmlData](#) represents the result of ENML to HTML conversion: HTML itself plus some metadata.

```
#include <IHtmlData.h>
```

Inheritance diagram for `quentier::enml::IHtmlData`:

Collaboration diagram for quantier::enml::IHtmlData:

### Public Member Functions

- [virtual QString html \(\) const =0](#)
- [virtual quint32 numEnToDoNodes \(\) const =0](#)
- [virtual quint32 numHyperlinkNodes \(\) const =0](#)
- [virtual quint32 numEnCryptNodes \(\) const =0](#)
- [virtual quint32 numEnDecryptedNodes \(\) const =0](#)
- [QTextStream & print \(QTextStream &strm\) const override](#)

### Public Member Functions inherited from [quantier::Printable](#)

- [QString toString \(\) const](#)

## 5.27.1 Detailed Description

The [IHtmlData](#) represents the result of ENML to HTML conversion: HTML itself plus some metadata.

## 5.27.2 Member Function Documentation

### 5.27.2.1 html()

```
virtual QString quantier::enml::IHtmlData::html ( ) const [pure virtual]
```

HTML representation of note content

### 5.27.2.2 numEnCryptNodes()

```
virtual quint32 quantier::enml::IHtmlData::numEnCryptNodes ( ) const [pure virtual]
```

Number of en-crypt nodes within note HTML

### 5.27.2.3 numEnDecryptedNodes()

```
virtual quint32 quentier::enml::IHtmlData::numEnDecryptedNodes ( ) const [pure virtual]
```

Number of decrypted en-crypt nodes within note HTML

### 5.27.2.4 numEnToDoNodes()

```
virtual quint32 quentier::enml::IHtmlData::numEnToDoNodes ( ) const [pure virtual]
```

Number of ToDo nodes within note HTML

### 5.27.2.5 numHyperlinkNodes()

```
virtual quint32 quentier::enml::IHtmlData::numHyperlinkNodes ( ) const [pure virtual]
```

Number of hyperlink nodes within note HTML

### 5.27.2.6 print()

```
QTextStream & quentier::enml::IHtmlData::print (
    QTextStream & strm ) const [override], [virtual]
```

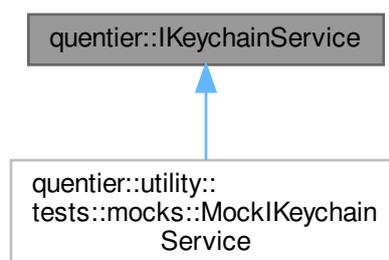

Implements [quentier::Printable](#).

## 5.28 quentier::IKeychainService Class Reference

The [IKeychainService](#) interface provides the ability to interact with the storage of sensitive data - read, write and delete it.

```
#include <IKeychainService.h>
```

Inheritance diagram for quentier::IKeychainService:

## Classes

- class [Exception](#)

The `IKeychainService::Exception` class is the base class for exceptions returned inside `QFutures` from methods of `IKeychainService`.

## Public Types

- enum class [ErrorCode](#) {  
[NoError](#) , [EntryNotFound](#) , [CouldNotDeleteEntry](#) , [AccessDeniedByUser](#) ,  
[AccessDenied](#) , [NoBackendAvailable](#) , [NotImplemented](#) , [OtherError](#) }

## Public Member Functions

- virtual `QFuture< void >` [writePassword](#) (`QString` service, `QString` key, `QString` password)=0
- virtual `QFuture< QString >` [readPassword](#) (`QString` service, `QString` key) `const` =0
- virtual `QFuture< void >` [deletePassword](#) (`QString` service, `QString` key)=0

## Friends

- `QUENTIER_EXPORT` `QTextStream` & `operator<<` (`QTextStream` &strm, `ErrorCode` errorCode)
- `QUENTIER_EXPORT` `QDebug` & `operator<<` (`QDebug` &dbg, `ErrorCode` errorCode)

## 5.28.1 Detailed Description

The `IKeychainService` interface provides the ability to interact with the storage of sensitive data - read, write and delete it.

## 5.28.2 Member Enumeration Documentation

### 5.28.2.1 ErrorCode

```
enum class quentier::IKeychainService::ErrorCode [strong]
```

Error codes for results of operations with the keychain service

#### Enumerator

<code>NoError</code>	No error occurred, operation was successful
<code>EntryNotFound</code>	For the given key no data was found
<code>CouldNotDeleteEntry</code>	Could not delete existing secret data
<code>AccessDeniedByUser</code>	User denied access to keychain
<code>AccessDenied</code>	Access denied for some reason
<code>NoBackendAvailable</code>	No platform-specific keychain service available
<code>NotImplemented</code>	Not implemented on platform
<code>OtherError</code>	Something else went wrong, the error description specifies what

## 5.28.3 Member Function Documentation

### 5.28.3.1 deletePassword()

```
virtual QFuture< void > quentier::IKeychainService::deletePassword (
    QString service,
    QString key ) [pure virtual]
```

deletePassword potentially asynchronously deletes password from the keychain.

#### Parameters

<i>service</i>	Name of service within the keychain
<i>key</i>	Key under which the password is stored

#### Returns

Future which becomes finished when the operation is complete. If the operation fails, the future would contain an exception.

### 5.28.3.2 readPassword()

```
virtual QFuture< QString > quentier::IKeychainService::readPassword (
    QString service,
    QString key ) const [pure virtual]
```

readPassword method potentially asynchronously reads password from the keychain.

#### Parameters

<i>service</i>	Name of service within the keychain
<i>key</i>	Key under which the password is stored

#### Returns

Future which becomes finished when the operation is complete. The value inside the future would be the read password. If the operation fails, the future would contain an exception.

### 5.28.3.3 writePassword()

```
virtual QFuture< void > quentier::IKeychainService::writePassword (
    QString service,
    QString key,
    QString password ) [pure virtual]
```

writePassword method potentially asynchronously writes password to the keychain.

## Parameters

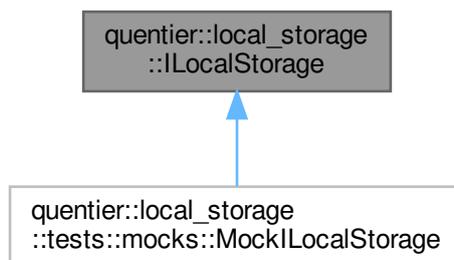

<i>service</i>	Name of service within the keychain
<i>key</i>	Key to store the password under
<i>password</i>	Password to store in the keychain

## Returns

Future which becomes finished when the operation is complete. If the operation fails, the future would contain an exception.

## 5.29 quantier::local\_storage::ILocalStorage Class Reference

Inheritance diagram for quantier::local\_storage::ILocalStorage:

## 5.29.1 Member Enumeration Documentation

### 5.29.1.1 Affiliation

```
enum class quentier::local_storage::ILocalStorage::Affiliation [strong]
```

Denotes whether some data item belongs to user's own account, any of linked notebooks or particular linked notebooks

### 5.29.1.2 TagNotesRelation

```
enum class quentier::local_storage::ILocalStorage::TagNotesRelation [strong]
```

Denotes the relation between tag and notes - whether any note us using the given tag

#### Enumerator

Any	The tag might be used by some notes or it might not be.
WithNotes	The tag is used by some notes.
WithoutNotes	The tag is not used by any note.

## 5.29.2 Member Function Documentation

### 5.29.2.1 notifier()

```
virtual ILocalStorageNotifier * quantier::local_storage::ILocalStorage::notifier ( ) const
[pure virtual]
```

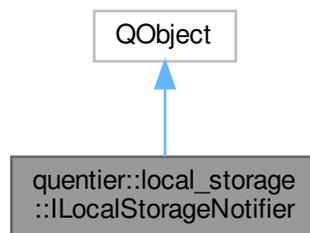

Notifications about the events occurring with the local storage are done via signals emitted by [ILocalStorageNotifier](#).

#### Returns

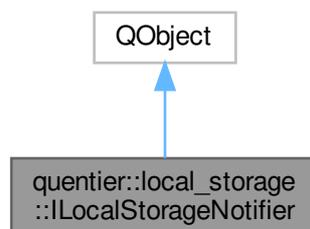

the pointer to [ILocalStorageNotifier](#) object which would be valid for at least as long as [ILocalStorage](#) object that returned it is alive.

## 5.30 quantier::local\_storage::ILocalStorageNotifier Class Reference

Inheritance diagram for `quantier::local_storage::ILocalStorageNotifier`:

Collaboration diagram for `quantier::local_storage::ILocalStorageNotifier`:

## Signals

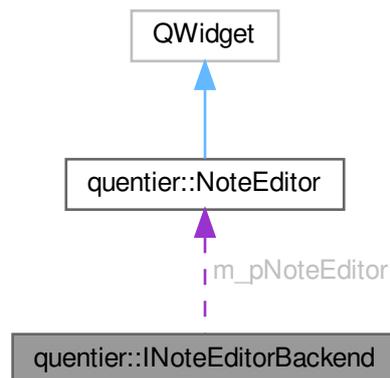

- `void userPut` (qevercloud::User `user`)
- `void userExpunged` (qevercloud::UserID `userId`)

- [virtual QFuture< void > restoreLocalStorageFromBackup \(\)=0](#)
- [virtual QFuture< void > removeLocalStorageBackup \(\)=0](#)
- [virtual QFuture< void > apply \(\)=0](#)

### 5.35.1 Detailed Description

The `IPatch` interface represents patches of the local storage. Each such patch somehow changes the layout of local storage persistence so that only compliant & corresponding versions of libquentier can be used to work with it.

### 5.35.2 Member Function Documentation

#### 5.35.2.1 `apply()`

```
virtual QFuture< void > quentier::local_storage::IPatch::apply ( ) [pure virtual]
```

Apply the patch to local storage

##### Returns

Future which can be awaited for patch application. Contains exception if patch application fails.

#### 5.35.2.2 `backupLocalStorage()`

```
virtual QFuture< void > quentier::local_storage::IPatch::backupLocalStorage ( ) [pure virtual]
```

Backup either the entire local storage or its parts affected by the particular patch, should be called before applying the patch (but can be skipped if not desired).

##### Returns

Future which can be awaited for the backup completion. Contains exception if backup fails.

#### 5.35.2.3 `fromVersion()`

```
virtual int quentier::local_storage::IPatch::fromVersion ( ) const [pure virtual], [noexcept]
```

##### Returns

Version of local storage to which the patch needs to be applied

#### 5.35.2.4 `patchLongDescription()`

```
virtual QString quentier::local_storage::IPatch::patchLongDescription ( ) const [pure virtual]
```

##### Returns

Long i.e. detailed description of the patch

### 5.35.2.5 patchShortDescription()

```
virtual QString quentier::local_storage::IPatch::patchShortDescription ( ) const [pure virtual]
```

#### Returns

Short description of the patch

### 5.35.2.6 removeLocalStorageBackup()

```
virtual QFuture< void > quentier::local_storage::IPatch::removeLocalStorageBackup ( ) [pure virtual]
```

Remove the previously made backup of local storage, presumably after successful application of the patch so the backup is no longer needed. It won't work if no backup was made before applying a patch, obviously.

#### Returns

Future which can be awaited for local storage backup removal. Contains exception if backup removal fails.

### 5.35.2.7 restoreLocalStorageFromBackup()

```
virtual QFuture< void > quentier::local_storage::IPatch::restoreLocalStorageFromBackup ( ) [pure virtual]
```

Restore local storage from previously made backup, presumably after the failed attempt to apply a patch. Won't work if no backup was made before applying a patch, obviously.

#### Returns

Future which can be awaited for the backup restoration completion. Contains exception if backup restoration fails.

### 5.35.2.8 toVersion()

```
virtual int quentier::local_storage::IPatch::toVersion ( ) const [pure virtual], [noexcept]
```

#### Returns

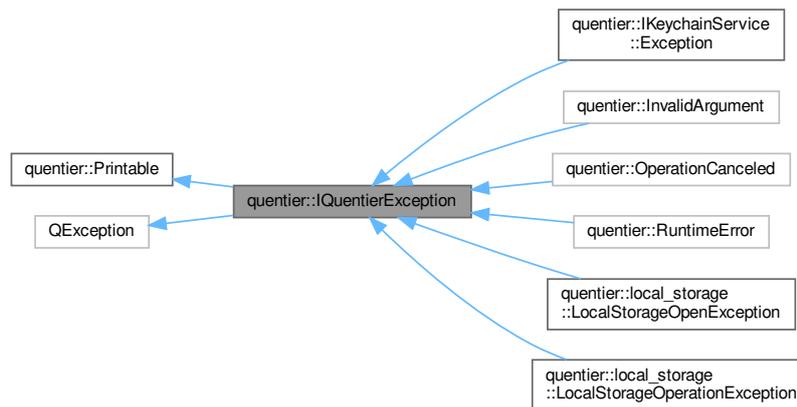

Version of local storage to which the patch would upgrade the local storage

## 5.36 `quentier::IQuentierException` Class Reference

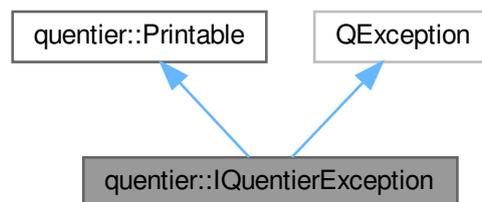

The `IQuentierException` class represents the interface for exceptions specific to libquentier and applications based on it.

```
#include <IQuentierException.h>
```

Inheritance diagram for `quentier::IQuentierException`:

Collaboration diagram for `quentier::IQuentierException`:

### Public Member Functions

- `ErrorString errorMessage () const`
- `QString localizedErrorMessage () const`
- `QString nonLocalizedErrorMessage () const`
- `const char * what () const noexcept override`
- `QTextStream & print (QTextStream &strm) const override`

### Public Member Functions inherited from `quentier::Printable`

- `QString toString () const`

## Protected Member Functions

- `IQuentierException` (`QString message`)
- `IQuentierException` (`const IQuentierException &other`)
- `IQuentierException` & `operator=` (`const IQuentierException &other`)
- `virtual QString exceptionDisplayName () const =0`

### 5.36.1 Detailed Description

The `IQuentierException` class represents the interface for exceptions specific to libquentier and applications based on it.

In addition to standard exception features inherited from `std::exception`, `IQuentierException` based exceptions can provide both localized and non-localized error messages.

### 5.36.2 Member Function Documentation

#### 5.36.2.1 `print()`

```
QTextStream & quentier::IQuentierException::print (
    QTextStream & strm ) const [override], [virtual]
```

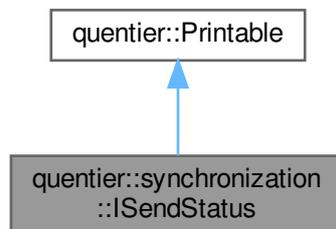

Implements `quentier::Printable`.

## 5.37 `quentier::synchronization::ISendStatus` Class Reference

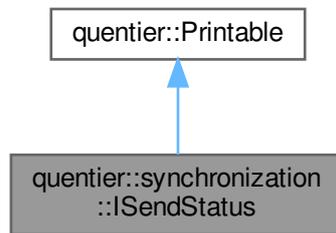

The `ISendStatus` interface represents the information about the attempt to send information either from user's own account or from some linked notebook to Evernote.

```
#include <ISendStatus.h>
```

Inheritance diagram for `quentier::synchronization::ISendStatus`:

Collaboration diagram for `quentier::synchronization::ISendStatus`:

### Public Types

- [using QExceptionPtr](#) = `std::shared_ptr< QException >`
- [using NoteWithException](#) = `std::pair< qevercloud::Note, QExceptionPtr >`

- [virtual QList< TagWithException > failedToSendTags \(\) const =0](#)
- [virtual StopSynchronizationError stopSynchronizationError \(\) const =0](#)
- [virtual bool needToRepeatIncrementalSync \(\) const =0](#)

### Public Member Functions inherited from [quentier::Printable](#)

- [virtual QTextStream & print \(QTextStream &strm\) const =0](#)
- [QString toString \(\) const](#)

#### 5.37.1 Detailed Description

The [ISendStatus](#) interface represents the information about the attempt to send information either from user's own account or from some linked notebook to Evernote.

## 5.37.2 Member Function Documentation

### 5.37.2.1 failedToSendNotebooks()

```
virtual QList< NotebookWithException > quantier::synchronization::ISendStatus::failedToSendNotebooks ( ) const [pure virtual]
```

#### Returns

list with notebooks and exceptions representing failures to send these notebooks to Evernote

### 5.37.2.2 failedToSendNotes()

```
virtual QList< NoteWithException > quantier::synchronization::ISendStatus::failedToSendNotes ( ) const [pure virtual]
```

#### Returns

list with notes and exceptions representing failures to send these notes to Evernote

### 5.37.2.3 failedToSendSavedSearches()

```
virtual QList< SavedSearchWithException > quantier::synchronization::ISendStatus::failedToSendSavedSearches ( ) const [pure virtual]
```

#### Returns

list with saved searches and exceptions representing failures to send these saved searches to Evernote

### 5.37.2.4 failedToSendTags()

```
virtual QList< TagWithException > quantier::synchronization::ISendStatus::failedToSendTags ( ) const [pure virtual]
```

#### Returns

list with tags and exceptions representing failures to send these tags to Evernote

### 5.37.2.5 needToRepeatIncrementalSync()

```
virtual bool quantier::synchronization::ISendStatus::needToRepeatIncrementalSync ( ) const [pure virtual]
```

If during the send step of synchronization it was found out that Evernote service's state of account has been updated since the last download step, returns true meaning that incremental download step should be repeated. Otherwise returns false.

### 5.37.2.6 `stopSynchronizationError()`

```
virtual StopSynchronizationError quentier::synchronization::ISendStatus::stopSynchronizationError ( ) const [pure virtual]
```

#### Returns

error which might have occurred during sending the data to Evernote which has prevented further attempts to send anything to Evernote or `std::monostate` if no such error has occurred

### 5.37.2.7 `totalAttemptedToSendNotebooks()`

```
virtual quint64 quentier::synchronization::ISendStatus::totalAttemptedToSendNotebooks ( ) const [pure virtual]
```

#### Returns

total number of notebooks attempted to be sent to Evernote

### 5.37.2.8 `totalAttemptedToSendNotes()`

```
virtual quint64 quentier::synchronization::ISendStatus::totalAttemptedToSendNotes ( ) const [pure virtual]
```

#### Returns

total number of notes attempted to be sent to Evernote

### 5.37.2.9 `totalAttemptedToSendSavedSearches()`

```
virtual quint64 quentier::synchronization::ISendStatus::totalAttemptedToSendSavedSearches ( ) const [pure virtual]
```

#### Returns

total number of saved searches attempted to be sent to Evernote

### 5.37.2.10 `totalAttemptedToSendTags()`

```
virtual quint64 quentier::synchronization::ISendStatus::totalAttemptedToSendTags ( ) const [pure virtual]
```

#### Returns

total number of tags attempted to be sent to Evernote

### 5.37.2.11 totalSuccessfullySentNotebooks()

```
virtual quint64 quentier::synchronization::ISendStatus::totalSuccessfullySentNotebooks ( )  
const [pure virtual]
```

#### Returns

number of notebooks which were successfully sent to Evernote

### 5.37.2.12 totalSuccessfullySentNotes()

```
virtual quint64 quentier::synchronization::ISendStatus::totalSuccessfullySentNotes ( ) const  
[pure virtual]
```

#### Returns

number of notes which were successfully sent to Evernote

### 5.37.2.13 totalSuccessfullySentSavedSearches()

```
virtual quint64 quentier::synchronization::ISendStatus::totalSuccessfullySentSavedSearches ( )  
const [pure virtual]
```

#### Returns

number of saved searches which were successfully sent to Evernote

### 5.37.2.14 totalSuccessfullySentTags()

```
virtual quint64 quentier::synchronization::ISendStatus::totalSuccessfullySentTags ( ) const  
[pure virtual]
```

#### Returns

number of tags which were successfully sent to Evernote

### Friends

- [QUENTIER\\_EXPORT QTextStream & operator<< \(QTextStream &strm, Target target\)](#)
- [QUENTIER\\_EXPORT QDebug & operator<< \(QDebug &dbg, Target target\)](#)

## 5.39.1 Detailed Description

The [ISkipRule](#) interface describes a conversion rule with regards to which some ENML/HTML element/attribute should be skipped during the conversion.

ENML format prohibits the use of certain HTML tags and attributes. This interface facilitates skipping these tags and attributes in the process of conversion from HTML to ENML

## 5.39.2 Member Enumeration Documentation

### 5.39.2.1 Target

```
enum class quentier::enml::conversion_rules::ISkipRule::Target [strong]
```

Target to be affected by the skip rule

#### Enumerator

Element	HTML element
AttributeName	HTML attribute with specified name
AttributeValue	HTML attribute with specified value

## 5.39.3 Member Function Documentation

### 5.39.3.1 caseSensitivity()

```
virtual Qt::CaseSensitivity quentier::enml::conversion_rules::ISkipRule::caseSensitivity ( )
const [pure virtual]
```

Case sensitivity for target name/value check

### 5.39.3.2 includeContents()

```
virtual bool quentier::enml::conversion_rules::ISkipRule::includeContents ( ) const [pure
virtual]
```

Specifies whether the element contents should be included without the element itself if it needs to be skipped or not

### 5.39.3.3 `matchMode()`

```
virtual MatchMode quentier::enml::conversion_rules::ISkipRule::matchMode ( ) const [pure virtual]
```

Match mode for name or value of the target

### 5.39.3.4 `print()`

```
QTextStream & quentier::enml::conversion_rules::ISkipRule::print ( QTextStream & strm ) const [override], [virtual]
```

Implements [quentier::Printable](#).

### 5.39.3.5 `target()`

```
virtual Target quentier::enml::conversion_rules::ISkipRule::target ( ) const [pure virtual]
```

Target to be affected by the skip rule

### 5.39.3.6 `value()`

```
virtual QString quentier::enml::conversion_rules::ISkipRule::value ( ) const [pure virtual]
```

Name or value of the target

## 5.40 `quentier::enml::conversion_rules::ISkipRuleBuilder` Class Reference

### 5.41.1 Detailed Description

The `ISyncChunksDataCounters` interface provides integer counters representing the current progress on processing the data from downloaded sync chunks.

### 5.41.2 Member Function Documentation

#### 5.41.2.1 `addedLinkedNotebooks()`

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::addedLinkedNotebooks ( )  
const [pure virtual], [noexcept]
```

Number of linked notebooks from sync chunks added to the local storage so far

#### 5.41.2.2 `addedNotebooks()`

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::addedNotebooks ( ) const  
[pure virtual], [noexcept]
```

Number of notebooks from sync chunks added to the local storage so far

#### 5.41.2.3 `addedSavedSearches()`

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::addedSavedSearches ( )  
const [pure virtual], [noexcept]
```

Number of saved searches from sync chunks added to the local storage so far

#### 5.41.2.4 addedTags()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::addedTags ( ) const [pure virtual], [noexcept]
```

Number of tags from sync chunks added to the local storage so far

#### 5.41.2.5 expungedLinkedNotebooks()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::expungedLinkedNotebooks ( ) const [pure virtual], [noexcept]
```

Number of linked notebooks from sync chunks expunged from the local storage so far

#### 5.41.2.6 expungedNotebooks()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::expungedNotebooks ( ) const [pure virtual], [noexcept]
```

Number of notebooks from sync chunks expunged from the local storage so far

#### 5.41.2.7 expungedSavedSearches()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::expungedSavedSearches ( ) const [pure virtual], [noexcept]
```

Number of saved searches from sync chunks expunged from the local storage so far

#### 5.41.2.8 expungedTags()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::expungedTags ( ) const [pure virtual], [noexcept]
```

Number of tags from sync chunks expunged from the local storage so far

#### 5.41.2.9 totalExpungedLinkedNotebooks()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::totalExpungedLinkedNotebooks ( ) const [pure virtual], [noexcept]
```

Total number of expunged saved searches in downloaded sync chunks

#### 5.41.2.10 totalExpungedNotebooks()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::totalExpungedNotebooks ( ) const [pure virtual], [noexcept]
```

Total number of expunged notebooks in downloaded sync chunks

#### 5.41.2.11 totalExpungedSavedSearches()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::totalExpungedSavedSearches  
( ) const [pure virtual], [noexcept]
```

Total number of expunged saved searches in downloaded sync chunks

#### 5.41.2.12 totalExpungedTags()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::totalExpungedTags ( )  
const [pure virtual], [noexcept]
```

Total number of expunged tags in downloaded sync chunks

#### 5.41.2.13 totalLinkedNotebooks()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::totalLinkedNotebooks ( )  
const [pure virtual], [noexcept]
```

Total number of new or updated linked notebooks in downloaded sync chunks

#### 5.41.2.14 totalNotebooks()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::totalNotebooks ( ) const  
[pure virtual], [noexcept]
```

Total number of new or updated notebooks in downloaded sync chunks

#### 5.41.2.15 totalSavedSearches()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::totalSavedSearches ( )  
const [pure virtual], [noexcept]
```

Total number of new or updated saved searches in downloaded sync chunks

#### 5.41.2.16 totalTags()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::totalTags ( ) const [pure  
virtual], [noexcept]
```

Total number of new or updated tags in downloaded sync chunks

#### 5.41.2.17 updatedLinkedNotebooks()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::updatedLinkedNotebooks ( )  
const [pure virtual], [noexcept]
```

Number of linked notebooks from sync chunks updated in the local storage so far

### 5.41.2.18 updatedNotebooks()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::updatedNotebooks ( ) const
[pure virtual], [noexcept]
```

Number of notebooks from sync chunks updated in the local storage so far

### 5.41.2.19 updatedSavedSearches()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::updatedSavedSearches ( )
const [pure virtual], [noexcept]
```

Number of saved searches from sync chunks updated in the local storage so far

### 5.41.2.20 updatedTags()

```
virtual quint64 quentier::synchronization::ISyncChunksDataCounters::updatedTags ( ) const
[pure virtual], [noexcept]
```

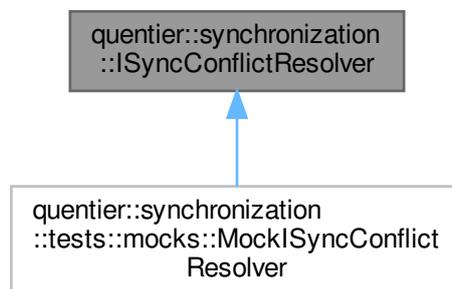

Number of tags from sync chunks updated in the local storage so far

## 5.42 quentier::synchronization::ISyncConflictResolver Class Reference

The [ISyncConflictResolver](#) interface provides methods used to resolve conflicts between local and remote versions of the same data item.

```
#include <ISyncConflictResolver.h>
```

Inheritance diagram for quentier::synchronization::ISyncConflictResolver:

### Classes

- struct [ConflictResolution](#)

The [ConflictResolution](#) struct is a namespace inside which several other structs determining actual conflict resolutions.

## Public Types

- using **NotebookConflictResolution** = `std::variant< ConflictResolution::UseTheirs, ConflictResolution::UseMine, ConflictResolution::IgnoreMine, ConflictResolution::MoveMine< qevercloud::Notebook > >`
- using **NoteConflictResolution** = `std::variant< ConflictResolution::UseTheirs, ConflictResolution::UseMine, ConflictResolution::IgnoreMine, ConflictResolution::MoveMine< qevercloud::Note > >`
- using **SavedSearchConflictResolution** = `std::variant< ConflictResolution::UseTheirs, ConflictResolution::UseMine, ConflictResolution::IgnoreMine, ConflictResolution::MoveMine< qevercloud::SavedSearch > >`
- using **TagConflictResolution** = `std::variant< ConflictResolution::IgnoreMine, ConflictResolution::UseTheirs, ConflictResolution::UseMine, ConflictResolution::MoveMine< qevercloud::Tag > >`

## Public Member Functions

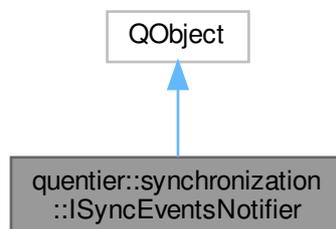

- virtual `QFuture< NotebookConflictResolution >` **resolveNotebookConflict** (`qevercloud::Notebook theirs`, `qevercloud::Notebook mine`)=0
- virtual `QFuture< NoteConflictResolution >` **resolveNoteConflict** (`qevercloud::Note theirs`, `qevercloud::Note mine`)=0
- virtual `QFuture< SavedSearchConflictResolution >` **resolveSavedSearchConflict** (`qevercloud::SavedSearch theirs`, `qevercloud::SavedSearch mine`)=0
- virtual `QFuture< TagConflictResolution >` **resolveTagConflict** (`qevercloud::Tag theirs`, `qevercloud::Tag mine`)=0

### 5.42.1 Detailed Description

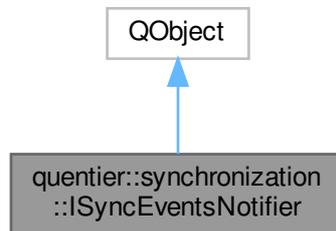

The `ISyncConflictResolver` interface provides methods used to resolve conflicts between local and remote versions of the same data item.

## 5.43 `quentier::synchronization::ISyncEventsNotifier` Class Reference

- `void userOwnSendStatusUpdate` (`ISendStatusPtr sendStatus`)
- `void linkedNotebookSendStatusUpdate` (`const qevercloud::Guid &linkedNotebookGuid`, `ISendStatusPtr sendStatus`)

## Protected Member Functions

- `ISyncEventsNotifier` (`QObject *parent=nullptr`)

## 5.43.1 Member Function Documentation

### 5.43.1.1 downloadFinished

```
void quentier::synchronization::ISyncEventsNotifier::downloadFinished (
    bool dataDownloaded ) [signal]
```

This signal is emitted when the initial download step is finished.

## Parameters

<i>dataDownloaded</i>	True if some data was actually downloaded during this step i.e. there were some updates on Evernote servers compared to local state, false otherwise.
-----------------------	---

5.43.1.2 `linkedNotebookNotesDownloadProgress`

```
void quentier::synchronization::ISyncEventsNotifier::linkedNotebookNotesDownloadProgress (
    quint32 notesDownloaded,
    quint32 totalNotesToDownload,
    const qevercloud::LinkedNotebook & linkedNotebook ) [signal]
```

This signal is emitted on each successful download of full note data from some linked notebook.

## Parameters

<i>notesDownloaded</i>	The number of notes downloaded by the moment
<i>totalNotesToDownload</i>	The total number of notes that need to be downloaded
<i>linkedNotebook</i>	The linked notebook which notes download progress is being reported

5.43.1.3 `linkedNotebookResourcesDownloadProgress`

```
void quentier::synchronization::ISyncEventsNotifier::linkedNotebookResourcesDownloadProgress (
    quint32 resourcesDownloaded,
    quint32 totalResourcesToDownload,
    const qevercloud::LinkedNotebook & linkedNotebook ) [signal]
```

This signal is emitted on each successful download of full resource data from linked notebooks during the incremental sync (as individual resources are downloaded along with their notes during full sync).

## Parameters

<i>resourcesDownloaded</i>	The number of resources downloaded by the moment
<i>totalResourcesToDownload</i>	The total number of resources that need to be downloaded
<i>linkedNotebook</i>	The linked notebook which resources download progress is being reported

5.43.1.4 `linkedNotebookSendStatusUpdate`

```
void quentier::synchronization::ISyncEventsNotifier::linkedNotebookSendStatusUpdate (
    const qevercloud::Guid & linkedNotebookGuid,
    ISendStatusPtr sendStatus ) [signal]
```

This signal is emitted on each successful or unsuccessful attempt to send some new or locally modified data item from some linked notebook to Evernote.

## Parameters

<i>linkedNotebookGuid</i>	Guid of the linked notebook for which the send status was updated
<i>sendStatus</i>	The updated send status

### 5.43.1.5 linkedNotebookSyncChunksDataProcessingProgress

```
void quantier::synchronization::ISyncEventsNotifier::linkedNotebookSyncChunksDataProcessing←
Progress (
    ISyncChunksDataCountersPtr counters,
    const qevercloud::LinkedNotebook & linkedNotebook ) [signal]
```

This signal is emitted during some linked notebook's downloaded sync chunks contents processing and denotes the progress on that step.

#### Parameters

<i>counters</i>	Updated sync chunks data counters
<i>linkedNotebook</i>	The linked notebook which sync chunks data processing progress is being reported

### 5.43.1.6 linkedNotebookSyncChunksDownloaded

```
void quantier::synchronization::ISyncEventsNotifier::linkedNotebookSyncChunksDownloaded (
    const qevercloud::LinkedNotebook & linkedNotebook ) [signal]
```

This signal is emitted when the sync chunks for data from some linked notebook are downloaded during "remote to local" synchronization step

#### Parameters

<i>linkedNotebook</i>	The linked notebook which sync chunks were downloaded
-----------------------	---

### 5.43.1.7 linkedNotebookSyncChunksDownloadProgress

```
void quantier::synchronization::ISyncEventsNotifier::linkedNotebookSyncChunksDownloadProgress
(
    qint32 highestDownloadedUsn,
    qint32 highestServerUsn,
    qint32 lastPreviousUsn,
    const qevercloud::LinkedNotebook & linkedNotebook ) [signal]
```

This signal is emitted during linked notebooks sync chunks downloading and denotes the progress of that step, individually for each linked notebook. The percentage of completeness can be computed roughly as  $(\text{highestDownloadedUsn} - \text{lastPreviousUsn}) / (\text{highestServerUsn} - \text{lastPreviousUsn}) * 100\%$ .

#### Parameters

<i>highestDownloadedUsn</i>	The highest update sequence number within data items from linked notebook sync chunks downloaded so far
<i>highestServerUsn</i>	The current highest update sequence number within the linked notebook
<i>lastPreviousUsn</i>	The last update sequence number from previous sync of the given linked notebook; if current sync is the first one, this value is zero
<i>linkedNotebook</i>	The linked notebook which sync chunks download progress is reported

### 5.43.1.8 `notesDownloadProgress`

```
void quentier::synchronization::ISyncEventsNotifier::notesDownloadProgress (
    quint32 notesDownloaded,
    quint32 totalNotesToDownload ) [signal]
```

This signal is emitted on each successful download of full note data from user's own account.

#### Parameters

<i>notesDownloaded</i>	The number of notes downloaded by the moment
<i>totalNotesToDownload</i>	The total number of notes that need to be downloaded

### 5.43.1.9 `resourcesDownloadProgress`

```
void quentier::synchronization::ISyncEventsNotifier::resourcesDownloadProgress (
    quint32 resourcesDownloaded,
    quint32 totalResourcesToDownload ) [signal]
```

This signal is emitted on each successful download of full resource data from user's own account during the incremental sync (as individual resources are downloaded along with their notes during full sync).

#### Parameters

<i>resourcesDownloaded</i>	The number of resources downloaded by the moment
<i>totalResourcesToDownload</i>	The total number of resources that need to be downloaded

### 5.43.1.10 `startLinkedNotebooksDataDownloading`

```
void quentier::synchronization::ISyncEventsNotifier::startLinkedNotebooksDataDownloading (
    const QList< qevercloud::LinkedNotebook > & linkedNotebooks ) [signal]
```

This signal is emitted before the downloading of data corresponding to linked notebooks starts.

#### Parameters

<i>linkedNotebooks</i>	Linked notebooks the data from which will start being downloaded after the execution of this callback
------------------------	---

### 5.43.1.11 `syncChunksDataProcessingProgress`

```
void quentier::synchronization::ISyncEventsNotifier::syncChunksDataProcessingProgress (
    ISyncChunksDataCountersPtr counters ) [signal]
```

This signal is emitted during user own account's downloaded sync chunks contents processing and denotes the progress on that step.

### 5.43.1.12 syncChunksDownloaded

```
void quantier::synchronization::ISyncEventsNotifier::syncChunksDownloaded ( ) [signal]
```

This signal is emitted when the sync chunks for data from user's own account are downloaded during the download synchronization step.

### 5.43.1.13 syncChunksDownloadProgress

```
void quantier::synchronization::ISyncEventsNotifier::syncChunksDownloadProgress (
    qint32 highestDownloadedUsn,
    qint32 highestServerUsn,
    qint32 lastPreviousUsn ) [signal]
```

This signal is emitted during user own account's sync chunks downloading and denotes the progress of that step. The percentage of completeness can be computed roughly as  $(\text{highestDownloadedUsn} - \text{lastPreviousUsn}) / (\text{highestServerUsn} - \text{lastPreviousUsn}) * 100\%$ .

#### Parameters

<i>highestDownloadedUsn</i>	The highest update sequence number within data items from sync chunks downloaded so far
<i>highestServerUsn</i>	The current highest update sequence number within the account
<i>lastPreviousUsn</i>	The last update sequence number from previous sync; if current sync is the first one, this value is zero

### 5.43.1.14 userOwnSendStatusUpdate

```
void quantier::synchronization::ISyncEventsNotifier::userOwnSendStatusUpdate (
    ISendStatusPtr sendStatus ) [signal]
```

This signal is emitted on each successful or unsuccessful attempt to send some new or locally modified data item from user's own account to Evernote.

#### Parameters

<i>sendStatus</i>	The updated send status
-------------------	-------------------------

## 5.44 quantier::synchronization::ISynchronizer Class Reference

### Public Types

- `virtual std::optional< quint32 > maxConcurrentResourceDownloads () const =0`

## Public Member Functions inherited from [quentier::Printable](#)

- [virtual QTextStream & print \(QTextStream &strm\) const =0](#)
- [QString toString \(\) const](#)

### 5.45.1 Detailed Description

Options for synchronization process.

### 5.45.2 Member Function Documentation

#### 5.45.2.1 downloadNoteThumbnails()

```
virtual bool quentier::synchronization::ISyncOptions::downloadNoteThumbnails ( ) const [pure virtual]
```

Flag to enable or disable downloading of note thumbnails during the sync. Note thumbnails are stored inside the local storage along with other note data.

#### 5.45.2.2 inkNoteImagesStorageDir()

```
virtual std::optional< QDir > quentier::synchronization::ISyncOptions::inkNoteImagesStorageDir ( ) const [pure virtual]
```

Directory to store the downloaded ink note images. If this method returns `std::nullopt`, ink note images would not be downloaded during the sync.

Ink notes images data is stored inside note's resources but the format of the data is not documented, which makes it quite hard to implement note editor able to fully handle ink notes. An easier option is to visualize a static image corresponding to the last revision of the ink note. Such images need to be downloaded separately during the sync if they are required.

Ink note images are stored right in this directory without any subdirectories, file names correspond to pattern `<resource guid>.png`.

#### 5.45.2.3 maxConcurrentNoteDownloads()

```
virtual std::optional< quint32 > quentier::synchronization::ISyncOptions::maxConcurrentNoteDownloads ( ) const [pure virtual]
```

Maximal number of concurrent note downloads. Allowing unlimited concurrent note downloads can lead to errors due to reaching the platform's limit on the number of open files. If `std::nullopt` is returned, the default limit is used.

#### 5.45.2.4 maxConcurrentResourceDownloads()

```
virtual std::optional< quint32 > quentier::synchronization::ISyncOptions::maxConcurrentResourceDownloads ( ) const [pure virtual]
```

Maximal number of concurrent resource downloads. Allowing unlimited concurrent resource downloads can lead to errors due to reaching the platform's limit on the number of open files. If `std::nullopt` is returned, the default limit is used.

5.45.2.5 `requestContext()`

```
virtual qevercloud::IRequestContextPtr quentier::synchronization::ISyncOptions::requestContext
( ) const [pure virtual]
```

Request context with settings which should be used during the sync. If nullptr then request context with default settings would be used.

5.45.2.6 `retryPolicy()`

```
virtual qevercloud::IRetryPolicyPtr quentier::synchronization::ISyncOptions::retryPolicy ( )
const [pure virtual]
```

Retry policy which should be used during the sync. If nullptr then the default retry policy would be used.

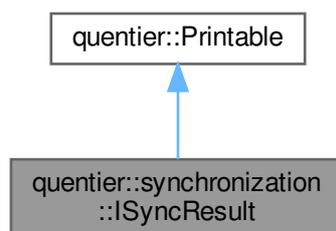

5.46 `quentier::synchronization::ISyncOptionsBuilder` Class Reference

- [OrderDirection](#) `m_direction` = OrderDirection::Ascending

## 5.61 [quentier::local\\_storage::LocalStorageOpenException](#) Class Reference

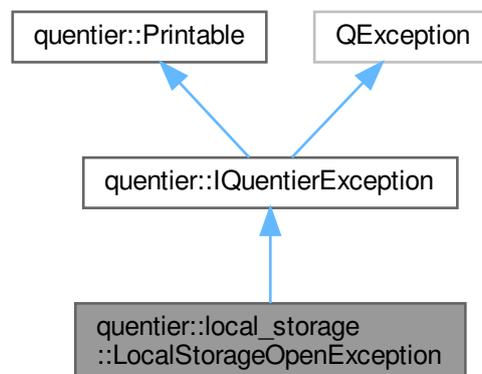

The [LocalStorageOpenException](#) is thrown on failure to open the local storage database.

```
#include <LocalStorageOpenException.h>
```

Inheritance diagram for [quentier::local\\_storage::LocalStorageOpenException](#):

Collaboration diagram for [quentier::local\\_storage::LocalStorageOpenException](#):

## Public Member Functions

- `LocalStorageOpenException` (`const QString &message`)
- `LocalStorageOpenException` \* `clone` () `const override`
- `void raise` () `const override`

## Public Member Functions inherited from `quentier::IQuentierException`

- `QString errorMessage` () `const`
- `QString localizedErrorMessage` () `const`
- `QString nonLocalizedErrorMessage` () `const`
- `const char * what` () `const noexcept override`
- `QTextStream & print` (`QTextStream &strm`) `const override`

## Public Member Functions inherited from `quentier::Printable`

- `QString toString` () `const`

## Protected Member Functions

- `QString exceptionDisplayName` () `const override`

## Protected Member Functions inherited from `quentier::IQuentierException`

- `IQuentierException` (`QString message`)
- `IQuentierException` (`const IQuentierException &other`)
- `IQuentierException & operator=` (`const IQuentierException &other`)

### 5.61.1 Detailed Description

The `LocalStorageOpenException` is thrown on failure to open the local storage database.

### 5.61.2 Member Function Documentation

#### 5.61.2.1 `exceptionDisplayName()`

```
QString quentier::local_storage::LocalStorageOpenException::exceptionDisplayName ( ) const  
[override], [protected], [virtual]
```

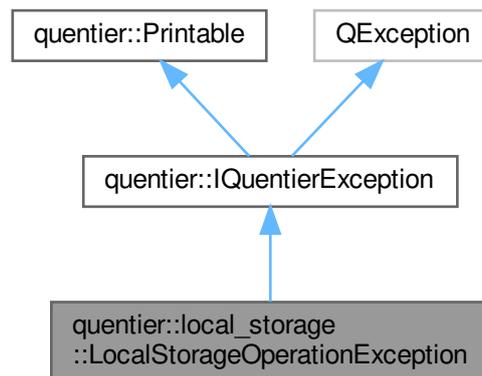

Implements `quentier::IQuentierException`.

## 5.62 `quentier::local_storage::LocalStorageOperationException` Class Reference

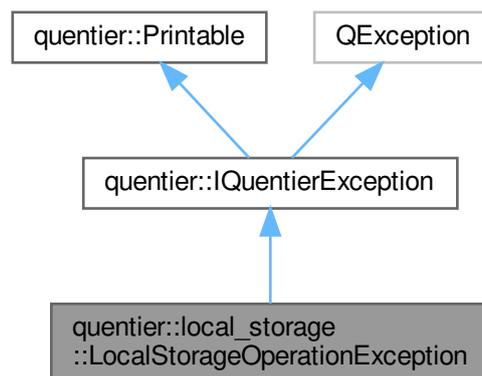

The `LocalStorageOperationException` is thrown when the local storage encounters some internal error during the attempt to process some operation.

```
#include <LocalStorageOperationException.h>
```

Inheritance diagram for `quentier::local_storage::LocalStorageOperationException`:

Collaboration diagram for `quentier::local_storage::LocalStorageOperationException`:

### Public Member Functions

- `LocalStorageOperationException` (`ErrorString message`)
- `LocalStorageOperationException * clone () const` override
- `void raise () const` override

## Public Member Functions inherited from `quentier::IQuentierException`

- `ErrorString errorMessage () const`
- `QString localizedErrorMessage () const`
- `QString nonLocalizedErrorMessage () const`
- `const char * what () const noexcept override`
- `QTextStream & print (QTextStream &strm) const override`

## Public Member Functions inherited from `quentier::Printable`

- `QString toString () const`

## Protected Member Functions

- `QString exceptionDisplayName () const override`

## Protected Member Functions inherited from `quentier::IQuentierException`

- `IQuentierException (ErrorString message)`
- `IQuentierException (const IQuentierException &other)`
- `IQuentierException & operator= (const IQuentierException &other)`

### 5.62.1 Detailed Description

The `LocalStorageOperationException` is thrown when the local storage encounters some internal error during the attempt to process some operation.

### 5.62.2 Member Function Documentation

#### 5.62.2.1 `exceptionDisplayName()`

```
QString quentier::local_storage::LocalStorageOperationException::exceptionDisplayName ( )
const [override], [protected], [virtual]
```

Implements `quentier::IQuentierException`.

## 5.63 `quentier::LRUCache< Key, Value, Allocator >` Class Template Reference

### Public Types

- `using key_type = Key`
- `using mapped_type = Value`
- `using allocator_type = Allocator`
- `using value_type = std::pair< key_type, mapped_type >`
- `using container_type = std::list< value_type, allocator_type >`
- `using size_type = typename container_type::size_type`
- `using difference_type = typename container_type::difference_type`
- `using iterator = typename container_type::iterator`
- `using const_iterator = typename container_type::const_iterator`
- `using reverse_iterator = std::reverse_iterator< iterator >`
- `using const_reverse_iterator = std::reverse_iterator< const_iterator >`
- `using reference = value_type &`
- `using const_reference = const value_type &`
- `using pointer = typename std::allocator_traits< allocator_type >::pointer`
- `using const_pointer = typename std::allocator_traits< allocator_type >::const_pointer`

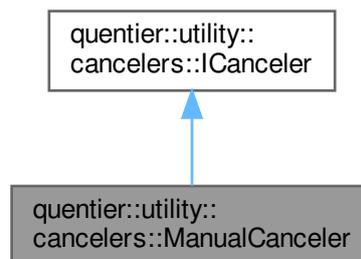

## Public Member Functions

- **LRUCache** (`const size_t maxSize=100`)
- iterator **begin** () `noexcept`
- const\_iterator **begin** () `const noexcept`
- reverse\_iterator **rbegin** () `noexcept`
- const\_reverse\_iterator **rbegin** () `const noexcept`
- iterator **end** () `noexcept`
- const\_iterator **end** () `const noexcept`
- reverse\_iterator **rend** () `noexcept`
- const\_reverse\_iterator **rend** () `const noexcept`
- **bool empty** () `const noexcept`
- **size\_t size** () `const noexcept`
- **size\_t max\_size** () `const noexcept`
- **void clear** ()
- **void put** (`const key_type &key, const mapped_type &value`)
- `const mapped_type * get` (`const key_type &key`) `const noexcept`
- **bool exists** (`const key_type &key`) `const noexcept`
- **bool remove** (`const key_type &key`) `noexcept`
- **void setMaxSize** (`const size_t maxSize`)

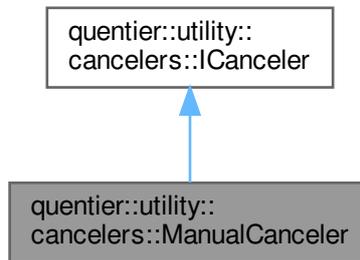

## 5.64 quantier::utility::cancelers::ManualCanceler Class Reference

```
#include <ManualCanceler.h>
```

Inheritance diagram for `quantier::utility::cancelers::ManualCanceler`:

Collaboration diagram for `quentier::utility::cancelers::ManualCanceler`:

### Public Member Functions

- `ManualCanceler` (`ManualCanceler &&other`) `noexcept`
- `ManualCanceler & operator=` (`ManualCanceler &&other`) `noexcept`
- `void cancel` () `noexcept`
- `bool isCanceled` () `const noexcept override`

### 5.64.1 Detailed Description

`ICanceler` which allows one to manually call `cancel` method to cancel some task

### 5.64.2 Member Function Documentation

#### 5.64.2.1 `cancel()`

```
void quentier::utility::cancelers::ManualCanceler::cancel ( ) [noexcept]
```

Manually cancel a task

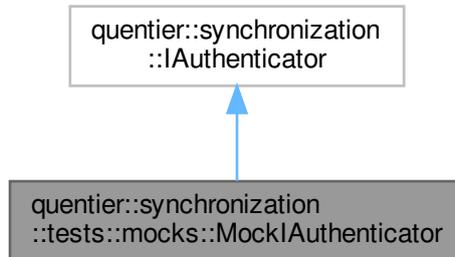

#### 5.64.2.2 `isCanceled()`

```
bool quentier::utility::cancelers::ManualCanceler::isCanceled ( ) const [override], [virtual], [noexcept]
```

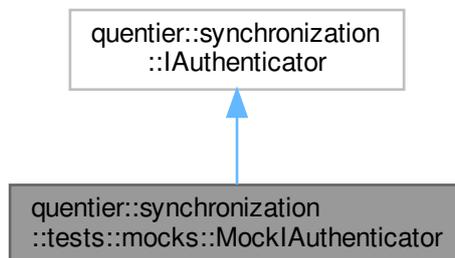

Implements `quentier::utility::cancelers::ICanceler`.

## 5.65 `quentier::synchronization::tests::mocks::MockIAuthenticator` Class Reference

Inheritance diagram for `quentier::synchronization::tests::mocks::MockIAuthenticator`:

Collaboration diagram for `quentier::synchronization::tests::mocks::MockIAuthenticator`:

### Public Member Functions

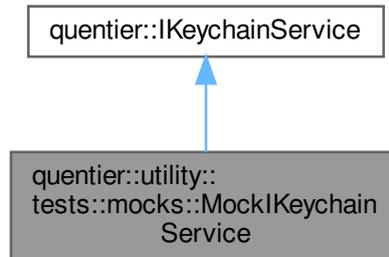

- **MOCK\_METHOD** (`QFuture< IAuthenticationInfoPtr >`, `authenticateNewAccount`, `()`, `(override)`)
- **MOCK\_METHOD** (`QFuture< IAuthenticationInfoPtr >`, `authenticateAccount`, `(Account account)`, `(override)`)

### Public Member Functions inherited from `quentier::synchronization::IAuthenticator`

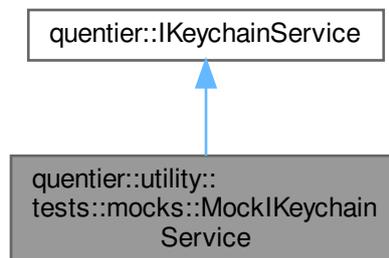

- `virtual QFuture< IAuthenticationInfoPtr > authenticateNewAccount ()=0`
- `virtual QFuture< IAuthenticationInfoPtr > authenticateAccount (Account account)=0`

## 5.66 `quentier::utility::tests::mocks::MockIKeychainService` Class Reference

Inheritance diagram for `quentier::utility::tests::mocks::MockIKeychainService`:

Collaboration diagram for `quentier::utility::tests::mocks::MockIKeychainService`:

### Public Member Functions

- **MOCK\_METHOD** (`QFuture< void >`, `writePassword`, (`QString service`, `QString key`, `QString password`), (`override`))
- **MOCK\_METHOD** (`QFuture< QString >`, `readPassword`, (`QString service`, `QString key`), (`const`, `override`))
- **MOCK\_METHOD** (`QFuture< void >`, `deletePassword`, (`QString service`, `QString key`), (`override`))

### Public Member Functions inherited from `quentier::IKeychainService`

- `virtual QFuture< void > writePassword (QString service, QString key, QString password)=0`
- `virtual QFuture< QString > readPassword (QString service, QString key) const =0`
- `virtual QFuture< void > deletePassword (QString service, QString key)=0`

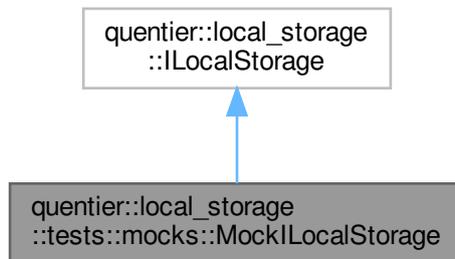

### Additional Inherited Members

### Public Types inherited from [quentier::IKeychainService](#)

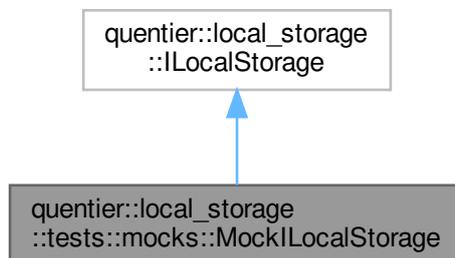

- enum class [ErrorCode](#) {  
    [NoError](#) , [EntryNotFound](#) , [CouldNotDeleteEntry](#) , [AccessDeniedByUser](#) ,  
    [AccessDenied](#) , [NoBackendAvailable](#) , [NotImplemented](#) , [OtherError](#) }

## 5.71 `quentier::synchronization::ISyncConflictResolver::ConflictResolution::MoveMine< T > Struct` Template Reference

The `MoveMine` conflict resolution means "before using theirs version change mine version as specified". Note: the data item inside this conflict resolution might refer to something different than mine version passed to the conflict resolution function. It can be that way because the actual conflict might be with another local data item instead of the passed one.

```
#include <ISyncConflictResolver.h>
```

## Public Types

- `using value_type = T`

## Public Attributes

- `T mine`

### 5.71.1 Detailed Description

```
template<class T>
struct quantier::synchronization::ISyncConflictResolver::ConflictResolution::MoveMine< T >
```

The `MoveMine` conflict resolution means "before using theirs version change mine version as specified". Note: the data item inside this conflict resolution might refer to something different than mine version passed to the conflict resolution function. It can be that way because the actual conflict might be with another local data item instead of the passed one.

### 5.71.2 Member Data Documentation

#### 5.71.2.1 mine

```
template<class T >
T quantier::synchronization::ISyncConflictResolver::ConflictResolution::MoveMine< T >::mine
```

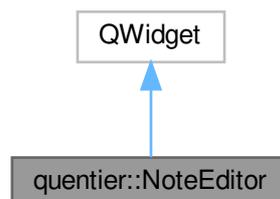

The changed value of mine data item.

## 5.72 quantier::NoteEditor Class Reference

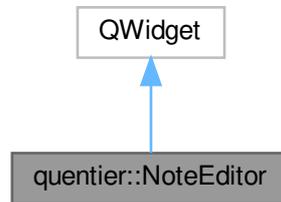

The `NoteEditor` class is a widget encapsulating all the functionality necessary for showing and editing notes.

```
#include <NoteEditor.h>
```

Inheritance diagram for `quantier::NoteEditor`:

Collaboration diagram for quantier::NoteEditor:

### Public Slots

## Signals

- [void contentChanged \(\)](#)  
*contentChanged signal is emitted when the note's content (text) gets modified via manual editing (i.e. not any action like paste or cut)*
- [void noteAndNotebookFoundInLocalStorage \(qevercloud::Note note, qevercloud::Notebook notebook\)](#)  
*noteAndNotebookFoundInLocalStorage signal is emitted when note and its corresponding notebook were found within the local storage right before the note editor starts to load the note into the editor*
- [void noteNotFound \(QString noteLocalId\)](#)  
*noteNotFound signal is emitted when the note could not be found within the local storage by the provided local id*
- [void noteDeleted \(QString noteLocalId\)](#)  
*noteDeleted signal is emitted when the note displayed within the note editor is deleted. The note editor stops displaying the note in this case shortly after emitting this signal*
- [void noteModified \(\)](#)  
*noteModified signal is emitted when the note's content within the editor gets modified via some way - either via manual editing or via some action (like paste or cut)*
- [void notifyError \(ErrorString error\)](#)  
*notifyError signal is emitted when [NoteEditor](#) encounters some problem worth letting the user to know about*
- [void inAppNoteLinkClicked \(QString userId, QString shardId, QString noteGuid\)](#)  
*inAppNoteLinkClicked signal is emitted when the in-app note link is clicked within the note editor*
- [void inAppNoteLinkPasteRequested \(QString url, QString userId, QString shardId, QString noteGuid\)](#)
- [void convertedToNote \(qevercloud::Note note\)](#)
- [void cantConvertToNote \(ErrorString error\)](#)
- [void noteEditorHtmlUpdated \(QString html\)](#)
- [void currentNoteChanged \(qevercloud::Note note\)](#)

- `void spellCheckerNotReady ()`
- `void spellCheckerReady ()`
- `void noteLoaded ()`
- `void noteSavedToLocalStorage (QString noteLocalId)`  
*noteSavedToLocalStorage signal is emitted when the note has been saved within the local storage. `NoteEditor` doesn't do this on its own unless it's explicitly asked to do this via invoking its `saveNoteToLocalStorage` slot*
- `void failedToSaveNoteToLocalStorage (ErrorString errorDescription, QString noteLocalId)`  
*failedToSaveNoteToLocalStorage signal is emitted in case of failure to save the note to local storage*
- `void textBoldState (bool state)`
- `void textItalicState (bool state)`
- `void textUnderlineState (bool state)`
- `void textStrikethroughState (bool state)`
- `void textAlignLeftState (bool state)`
- `void textAlignCenterState (bool state)`
- `void textAlignRightState (bool state)`
- `void textAlignFullState (bool state)`
- `void textInsideOrderedListState (bool state)`
- `void textInsideUnorderedListState (bool state)`
- `void textInsideTableState (bool state)`
- `void textFontFamilyChanged (QString fontFamily)`
- `void textFontSizeChanged (int fontSize)`
- `void insertTableDialogRequested ()`

## Public Member Functions

## Protected Member Functions

- `void dragMoveEvent (QDragMoveEvent *pEvent) override`
- `void dropEvent (QDropEvent *pEvent) override`

### 5.72.1 Detailed Description

The `NoteEditor` class is a widget encapsulating all the functionality necessary for showing and editing notes.

### 5.72.2 Member Function Documentation

#### 5.72.2.1 backend()

```
InoteEditorBackend * quentier::NoteEditor::backend ( ) [noexcept]
```

##### Returns

the pointer to the note editor's backend

#### 5.72.2.2 clear()

```
void quentier::NoteEditor::clear ( )
```

Clear the contents of the note editor

#### 5.72.2.3 convertToNote

```
void quentier::NoteEditor::convertToNote ( ) [slot]
```

Invoke this slot to launch the asynchronous procedure of converting the current contents of the note editor to note; the `convertedToNote` signal would be emitted in response when the conversion is done

#### 5.72.2.4 currentNoteLocalId()

```
QString quentier::NoteEditor::currentNoteLocalId ( ) const
```

Get the local id of the note currently set to the note editor

#### 5.72.2.5 defaultFont()

```
const QFont * quentier::NoteEditor::defaultFont ( ) const
```

##### Returns

pointer to the default font used by the note editor; if no such font was set to the editor previously, returns null pointer

### 5.72.2.6 `defaultPalette()`

```
QPalette quentier::NoteEditor::defaultPalette ( ) const
```

#### Returns

palette containing default colors used by the editor; the palette is composed of colors from note editor widget's native palette but some of them might be overridden by colors from the palette specified previously via `setDefaultPalette` method: those colors from the specified palette which were valid

### 5.72.2.7 `idleTime()`

```
qint64 quentier::NoteEditor::idleTime ( ) const [noexcept]
```

#### Returns

the number of milliseconds since the last user's interaction with the note editor or -1 if there was no interaction or if no note is loaded at the moment

### 5.72.2.8 `inAppNoteLinkPasteRequested`

```
void quentier::NoteEditor::inAppNoteLinkPasteRequested (
    QString url,
    QString userId,
    QString shardId,
    QString noteGuid ) [signal]
```

`inAppNoteLinkPasteRequested` signal is emitted when the note editor detects the attempt to paste the in-app note link into the note editor; the link would not be inserted right away, instead this signal would be emitted. Whatever party managing the note editor is expected to connect some slot to this signal and provide the optionally amended link information to the note editor by sending the signal connected to its `insertInAppNoteLink` slot - this slot accepts both the URL of the link and the link text and performs the actual link insertion into the note. If the link text is empty, the URL itself is used as the link text.

### 5.72.2.9 `initialize()`

```
void quentier::NoteEditor::initialize (
    local_storage::ILocalStoragePtr localStorage,
    SpellChecker & spellChecker,
    const Account & account,
    QThread * pBackgroundJobsThread = nullptr )
```

`NoteEditor` requires `LocalStorageManagerAsync`, `SpellChecker` and `Account` for its work but due to the particularities of Qt's .ui files processing these can't be passed right inside the constructor, hence here's a special initialization method

#### Parameters

<code>localStorage</code>	Local storage
<code>spellChecker</code>	Spell checker to be used by note editor
<code>account</code>	Current account
<code>pBackgroundJobsThread</code>	Pointer to the thread to be used for scheduling of background jobs of <code>NoteEditor</code> ; if null, <code>NoteEditor</code> 's background jobs would take place in GUI thread

### 5.72.2.10 isEditorPageModified()

```
bool quantier::NoteEditor::isEditorPageModified ( ) const [noexcept]
```

#### Returns

true if there's content within the editor not yet converted to note, false otherwise

### 5.72.2.11 isModified()

```
bool quantier::NoteEditor::isModified ( ) const [noexcept]
```

#### Returns

true if there's content within the editor not yet converted to note or not saved to local storage, false otherwise

### 5.72.2.12 isNoteLoaded()

```
bool quantier::NoteEditor::isNoteLoaded ( ) const [noexcept]
```

#### Returns

true if the note last set to the editor has been fully loaded already, false otherwise

### 5.72.2.13 saveNoteToLocalStorage

```
void quantier::NoteEditor::saveNoteToLocalStorage ( ) [slot]
```

Invoke this slot to launch the asynchronous procedure of saving the modified current note back to the local storage. If no note is set to the editor or if the note is not modified, no action would be performed. Otherwise `noteSaved` ↔ `ToLocalStorage` signal would be emitted in case of successful saving or `failedToSaveNoteToLocalStorage` would be emitted otherwise

### 5.72.2.14 setAccount()

```
void quantier::NoteEditor::setAccount (
    const Account & account )
```

Set the current account to the note editor

### 5.72.2.15 setBackend()

```
void quantier::NoteEditor::setBackend (
    INoteEditorBackend * backend )
```

This method can be used to set the backend to the note editor; the note editor has the default backend so this method is not obligatory to be called

### 5.72.2.16 setCurrentNoteLocalId()

```
void quantier::NoteEditor::setCurrentNoteLocalId (
    const QString & noteLocalId )
```

Set note local id to the note editor. The note is being searched for within the local storage, in case of no note being found `noteNotFound` signal is emitted. Otherwise note editor page starts loading.

## Parameters

<i>note</i> ↔ <i>LocalId</i>	The local id of note
---------------------------------	----------------------

**5.72.2.17 setDefaultFont**

```
void quotientier::NoteEditor::setDefaultFont (
    const QFont & font ) [slot]
```

Sets the font which would be used by the editor by default

## Parameters

<i>font</i>	The font to be used by the editor by default
-------------	--

**5.72.2.18 setDefaultPalette**

```
void quotientier::NoteEditor::setDefaultPalette (
    const QPalette & pal ) [slot]
```

Sets the palette with colors to be used by the editor. New colors are applied after the note is fully loaded. If no note is set to the editor, the palette is simply remembered for the next note to be loaded into it.

Colors within the palette and their usage:

1. WindowText - used as default font color
2. Base - used as default background color
3. HighlightedText - used as font color for selected text
4. Highlight - used as background color for selected text

## Parameters

<i>pal</i>	The palette to be set. Invalid colors from it are substituted by colors from widget's palette by the editor
------------	---

**5.72.2.19 setFocus()**

```
void quotientier::NoteEditor::setFocus ( )
```

Sets the focus to the backend note editor widget

**5.72.2.20 setInitialPageHtml()**

```
void quotientier::NoteEditor::setInitialPageHtml (
    const QString & html )
```

Set the html to be displayed when the note is not set to the editor

### 5.72.2.21 setNoteDeletedPageHtml()

```
void quentier::NoteEditor::setNoteDeletedPageHtml (
    const QString & html )
```

Set the html to be displayed when the note set to the editor was deleted from the local storage (either marked as deleted or deleted permanently i.e. expunged)

### 5.72.2.22 setNoteLoadingPageHtml()

```
void quentier::NoteEditor::setNoteLoadingPageHtml (
    const QString & html )
```

Set the html to be displayed when the note set to the editor is being loaded into it

### 5.72.2.23 setNoteNotFoundPageHtml()

```
void quentier::NoteEditor::setNoteNotFoundPageHtml (
    const QString & html )
```

Set the html to be displayed when the note attempted to be set to the editor was not found within the local storage

### 5.72.2.24 setNoteTitle

```
void quentier::NoteEditor::setNoteTitle (
    const QString & noteTitle ) [slot]
```

Invoke this slot to set the title to the note displayed via the note editor. The note editor itself doesn't manage the note title in any way so any external code using the note editor can set the title to the note editor's note which would be considered modified if the title is new and then eventually the note would be saved to local storage

#### Parameters

<i>noteTitle</i>	The title of the note
------------------	-----------------------

### 5.72.2.25 setTagIds

```
void quentier::NoteEditor::setTagIds (
    const QStringList & tagLocalIds,
    const QStringList & tagGuids ) [slot]
```

Invoke this slot to set tag local ids and/or tag guides to the note displayed via the note editor. The note editor itself doesn't manage the note tags in any way so any external code using the note editor can set the tag ids to the note editor's internal note which would be considered modified if the tag ids are new and then eventually the note would be saved to local storage

#### Parameters

<i>tagLocalIds</i>	The list of tag local ids for the note
<i>tagGuids</i>	The list of tag guides for the note

### 5.72.2.26 `setUndoStack()`

```
void quentier::NoteEditor::setUndoStack (
    QUndoStack * pUndoStack )
```

Set the undo stack for the note editor to use

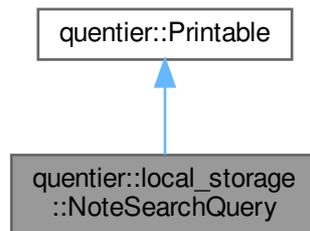

### 5.72.2.27 `undoStack()`

```
const QUndoStack * quentier::NoteEditor::undoStack ( ) const [noexcept]
```

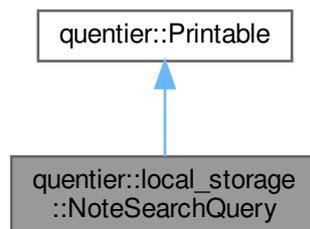

Get the undo stack serving to the note editor

## 5.73 `quentier::local_storage::NoteSearchQuery` Class Reference

## Public Member Functions inherited from `quentier::Printable`

- `QString toString () const`

### 5.73.1 Member Function Documentation

#### 5.73.1.1 `notebookModifier()`

```
QString quentier::local_storage::NoteSearchQuery::notebookModifier ( ) const
```

If query string has "notebook:<notebook name>" scope modifier, this method returns the name of the notebook, otherwise it returns empty string

### 5.73.1.2 print()

```
QTextStream & quentier::local_storage::NoteSearchQuery::print (
    QTextStream & strm ) const [override], [virtual]
```

Implements [quentier::Printable](#).

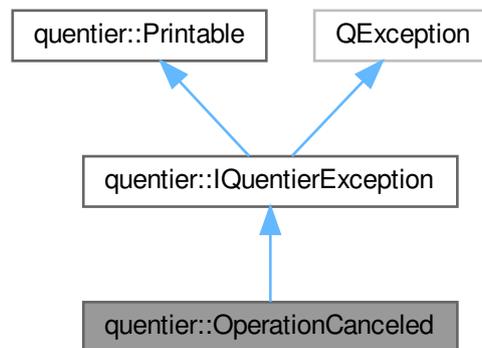

### 5.73.1.3 queryString()

```
QString quentier::local_storage::NoteSearchQuery::queryString ( ) const
```

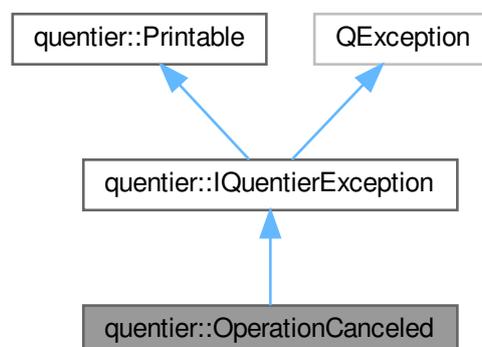

Returns the original non-parsed query string

## 5.74 quentier::OperationCanceled Class Reference

- `bool event` (`QEvent *pEvent`) *override*

## 5.78 quentier::QuentierUndoCommand Class Reference

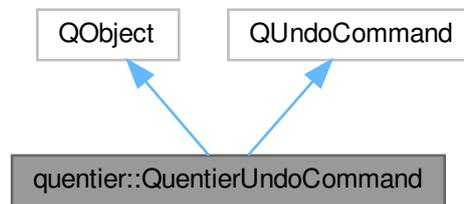

The `QuentierUndoCommand` class has the sole purpose of working around one quirky aspect of Qt's undo/redo framework: when you push `QUndoCommand` to `QUndoStack`, it calls "redo" method of that command. This class offers subclasses to implement their own methods for actual "undo" and "redo" commands while ignoring the attempts to "redo" anything if there were no previous "undo" call prior to that.

```
#include <QuentierUndoCommand.h>
```

Inheritance diagram for `quentier::QuentierUndoCommand`:

Collaboration diagram for `quentier::QuantierUndoCommand`:

### Signals

- `void notifyError (ErrorString error)`

### Public Member Functions

- `QuantierUndoCommand (QUndoCommand *parent=nullptr)`
- `QuantierUndoCommand (const QString &text, QUndoCommand *parent=nullptr)`
- `void undo () final`
- `void redo () final`
- `bool onceUndoExecuted () const noexcept`

### Protected Member Functions

- `virtual void undolmpl ()=0`
- `virtual void redolmpl ()=0`

## 5.78.1 Detailed Description

The `QuantierUndoCommand` class has the sole purpose of working around one quirky aspect of Qt's undo/redo framework: when you push `QUndoCommand` to `QUndoStack`, it calls "redo" method of that command. This class offers subclasses to implement their own methods for actual "undo" and "redo" commands while ignoring the attempts to "redo" anything if there were no previous "undo" call prior to that.

The rationale behind the current behaviour seems to be the compliance with "command pattern behaviour" when you create the command to execute the action instead of just executing it immediately. This design is enforced by Qt's undo/redo framework, there's no option to choose not to call "redo" when pushing to the stack.

One thing which this design fails to see is the fact that the command may be already executed externally by the moment the `QUndoCommand` can be created. Suppose we can get the information about how to undo (and then again redo) that command. We create the corresponding `QUndoCommand`, set up the stuff for its undo/redo methods and push it to `QUndoStack` for future use... But at the same time `QUndoStack` calls "redo" method of the command. Really not the behaviour you'd like to have.

`QuantierUndoCommand` is also `QObject`, it is for error reporting via `notifyError` signal

## 5.79 `quentier::synchronization::RateLimitReachedError` Struct Reference

```
#include <Errors.h>
```

### Public Attributes

- `std::optional< qint32 > rateLimitDurationSec`

### 5.79.1 Detailed Description

Information about "API rate limit reached" error which Evernote servers might return if too much of their API calls were made recently. In case of such error synchronization should be repeated later, after some time passes.

### 5.79.2 Member Data Documentation

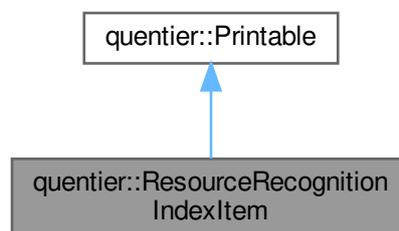

#### 5.79.2.1 `rateLimitDurationSec`

```
std::optional<qint32> quentier::synchronization::RateLimitReachedError::rateLimitDurationSec
```

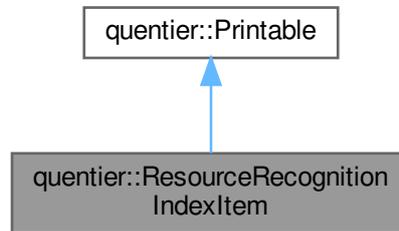

Number of seconds during which since the current moment during which any call to Evernote API would again result in "API rate limit reached" error i.e. the number of seconds to wait for before the next attempt to run synchronization

## 5.80 `quentier::ResourceRecognitionIndexItem` Class Reference

```

Implements `quentier::Printable`.

## 5.82 `quentier::Result< T, Error, typename >` Class Template Reference

The `Result` template class represents the bare bones result monad implementation which either contains some valid value or an error.

```
#include <Result.h>
```

### Public Member Functions

- `template<typename T1 = T, typename std::enable_if_t<!std::is_void_v< std::decay_t< T1 > > > * = nullptr>`  
`Result (T1 t)`
- `Result (Error error)`
- `Result (const Result< T, Error > &other)`
- `Result (Result< T, Error > &&other)`
- `Result & operator= (const Result< T, Error > &other)`
- `Result & operator= (Result< T, Error > &&other)`
- `bool isValid () const noexcept`
- `operator bool () const noexcept`
- `template<typename T1 = T, typename std::enable_if_t<!std::is_void_v< std::decay_t< T1 > > > * = nullptr>`  
`T1 & get ()`
- `template<typename T1 = T, typename std::enable_if_t<!std::is_void_v< std::decay_t< T1 > > > * = nullptr>`  
`const T1 & get () const`
- `template<typename T1 = T, typename std::enable_if_t<!std::is_void_v< std::decay_t< T1 > > > * = nullptr>`  
`T1 & operator* ()`
- `template<typename T1 = T, typename std::enable_if_t<!std::is_void_v< std::decay_t< T1 > > > * = nullptr>`  
`const T1 & operator* () const`
- `const Error & error () const`
- `Error & error ()`

### 5.82.1 Detailed Description

```
template<class T, class Error, typename = typename std::enable_if_t< !std::is_same_v<std::decay_t<T>,
std::decay_t<Error>>>>
class quentier::Result< T, Error, typename >
```

The `Result` template class represents the bare bones result monad implementation which either contains some valid value or an error.

### 5.82.2 Member Function Documentation

#### 5.82.2.1 `isValid()`

```
template<class T , class Error , typename = typename std::enable_if_t< !std::is_same_v<std::decay_t<T>,
std::decay_t<Error>>>>
bool quentier::Result< T, Error, typename >::isValid () const [inline], [noexcept]
```

#### Returns

boolean value indicating whether the result contains a value

### 5.83 `quentier::threading::detail::ResultTypeHelper< F, Arg, Enable >` Struct Template Reference

## 5.89.1 Member Function Documentation

### 5.89.1.1 defaultShortcut() [1/2]

```
QKeySequence quentier::ShortcutManager::defaultShortcut (
    const QString & nonStandardKey,
    const Account & account,
    const QString & context = {} ) const
```

#### Returns

Default shortcut for the non-standard key if present, otherwise empty key sequence

### 5.89.1.2 defaultShortcut() [2/2]

```
QKeySequence quentier::ShortcutManager::defaultShortcut (
    int key,
    const Account & account,
    const QString & context = {} ) const
```

#### Returns

Default shortcut for the standard key if present, otherwise empty key sequence

### 5.89.1.3 shortcut() [1/2]

```
QKeySequence quentier::ShortcutManager::shortcut (
    const QString & nonStandardKey,
    const Account & account,
    const QString & context = {} ) const
```

#### Returns

Active shortcut for the non-standard key - either the user defined shortcut (if present) or the default one (if present as well)

### 5.89.1.4 shortcut() [2/2]

```
QKeySequence quentier::ShortcutManager::shortcut (
    int key,
    const Account & account,
    const QString & context = {} ) const
```

#### Returns

Active shortcut for the standard key - either the user defined shortcut (if present) or the default one (if present as well)

### 5.89.1.5 userShortcut() [1/2]

```
QKeySequence quentier::ShortcutManager::userShortcut (
    const QString & nonStandardKey,
    const Account & account,
    const QString & context = {} ) const
```

#### Returns

User defined shortcut for the non-standard key if present, otherwise empty key sequence

### 5.89.1.6 userShortcut() [2/2]

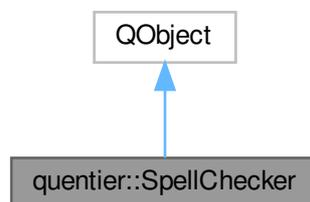

```
QKeySequence quentier::ShortcutManager::userShortcut (
    int key,
    const Account & account,
    const QString & context = {} ) const
```

#### Returns

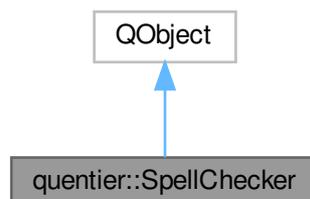

User defined shortcut for the standard key if present, otherwise empty key sequence

`function_pointer_v<Function>>>`  
`constexpr void operator() (Arguments &&... arguments) const`

### 5.93.1 Detailed Description

```
template<typename LockableObject, typename Function>
class quantier::threading::TrackedTask< LockableObject, Function >
```

Wrapper class which automates checking for the state of a lockable object. With this class code like this

```
auto task = [selfWeak = weak_from_this()] { auto self = selfWeak.lock(); if (!self) { return; } // otherwise do something
};
```

can be written like this:

```
auto task = threading::TrackedTask{weak_from_this(), &MyClass::someMethod};
```
